Cisco UCS as an Advanced Computing Platform for the Enterprise

Tae Hwang, Architect, Cisco

Tim Miller, Virtual Systems Engineer, Cisco

Bob Crovella, Solutions Architect, NVIDIA
TECINI-2543

INTUITIVE

Agenda

- Introduction
- Anatomy of Research Computing
- Demo and Hands-on Cluster Operations
- UCS as a Platform for Research Computing
- Hands-on Bonus: UCS Configuration with Ansible
- NVIDIA Deep Learning with GPUs
- Conclusion

Cisco Webex Teams

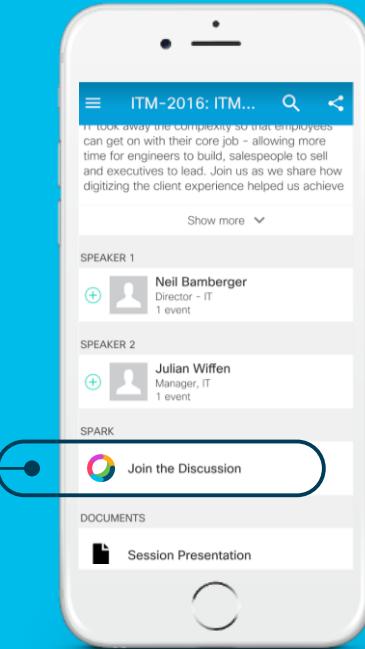

Questions?

Use Cisco Webex Teams (formerly Cisco Spark)
to chat with the speaker after the session

How

- 1 Find this session in the Cisco Live Mobile App
- 2 Click “Join the Discussion”
- 3 Install Webex Teams or go directly to the team space
- 4 Enter messages/questions in the team space

Webex Teams will be moderated
by the speaker until June 18, 2018.

cs.co/ciscolivebot#TECINI-2543

Timothy E. Miller, PhD, CCNA, RHCA(*)

- Linux User - 1993
- UNIX/Linux Systems Admin - 1995
- HPC Systems Engineer - 2002
- Network Engineer - 2008
- Network Architect - 2012
- Financial Services Vertical - 2015
- Cisco Systems Engineer - 2017
 - UCS, MDS, VXLAN EVPN, CloudCenter, Programmability, Docker/K8s

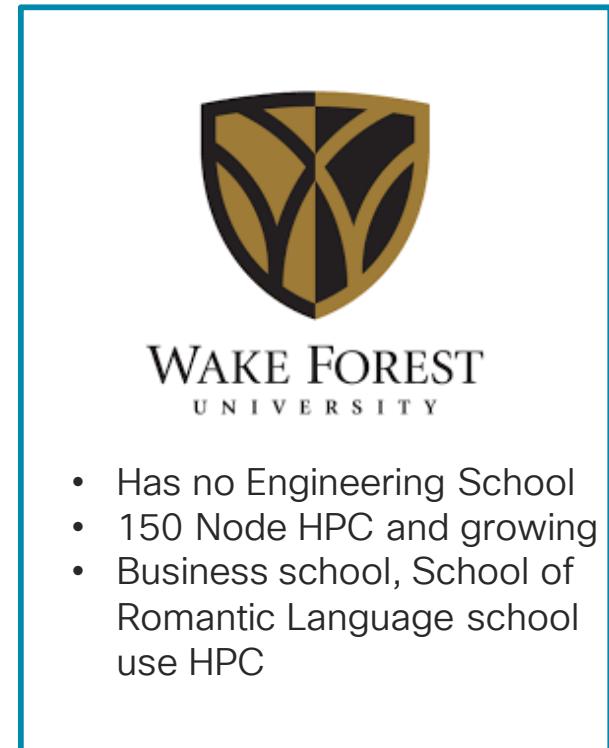

Agenda

- Introduction
- Anatomy of Research Computing
- Demo and Hands-on Cluster Operations
- UCS as a Platform for Research Computing
- Hands-on Bonus: UCS Configuration with Ansible
- NVIDIA Deep Learning with GPUs
- Conclusion

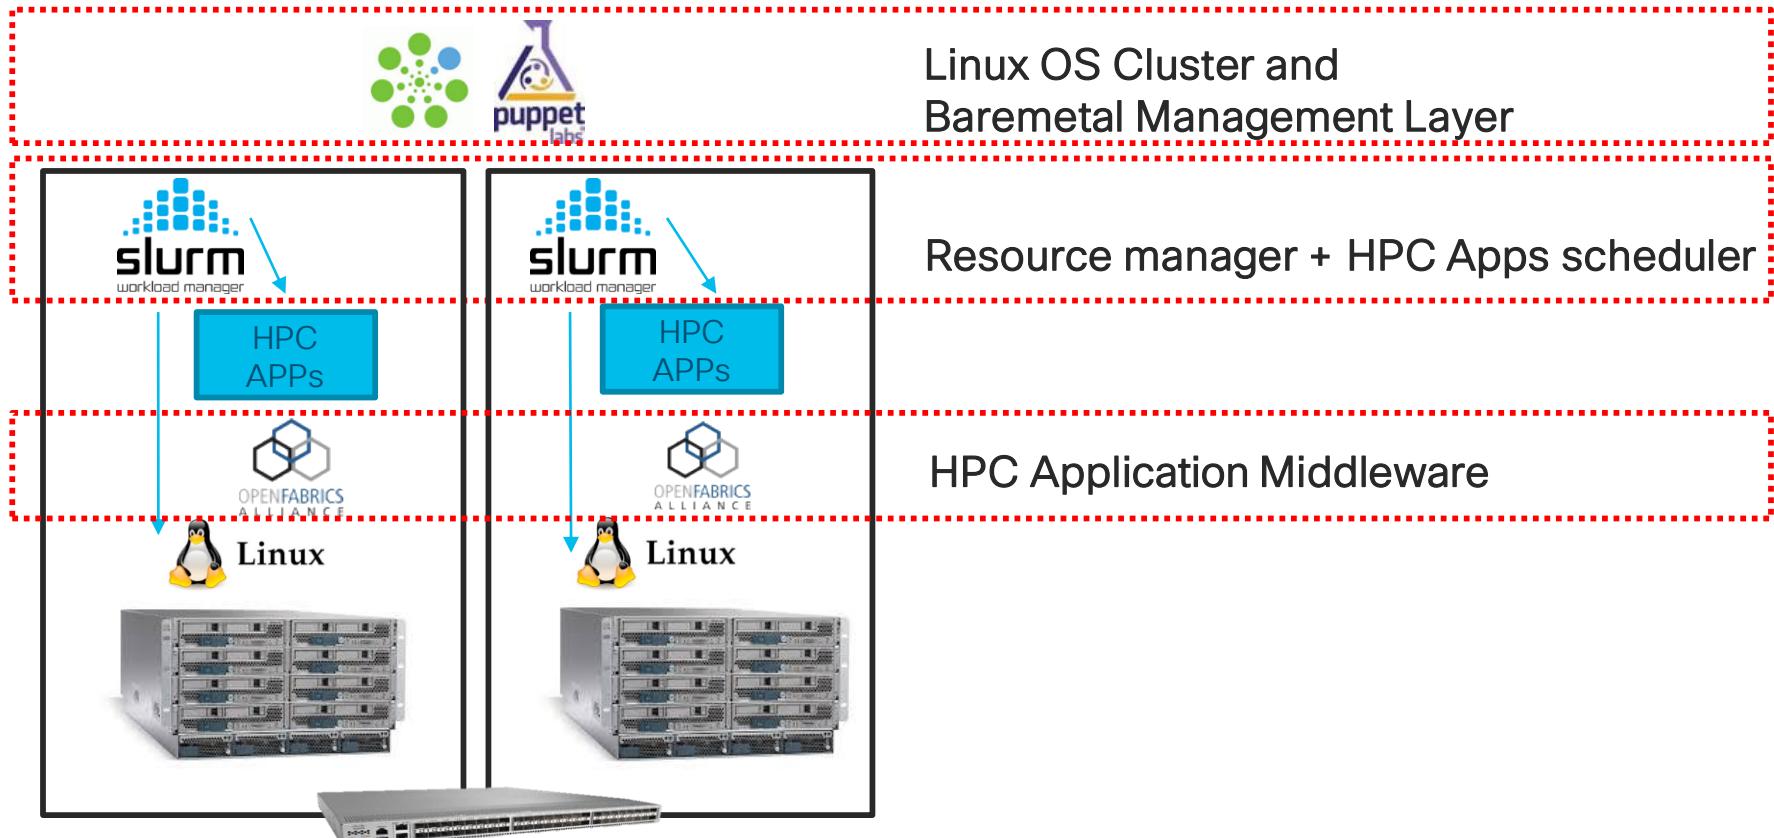

What is HPC?

Let's Define High Performance Computing

- x86 Clustered Linux Baremetal System that supports high computing needs.
- No longer FEW fastest Supercomputers in the world. Several nodes HPC cluster can support hundreds of CPU cores (thousands of GPU cores).
- Linux is the platform for science/research – traditional STEM computation, social science, economy/finance, Machine Learning, Big Data, and etc.
- 200 of Top500 use Ethernet as their fabric
- System Components: X86 System + Network/Fabirc (Ethernet, Infiniband, Omnipath, etc) + Storage + HPC Software*

HPC Components

Generally speaking...

Supercomputer

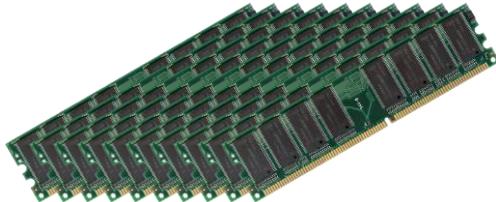

=

Lots of
processors

+

Lots of
RAM

+

Lots of
disk

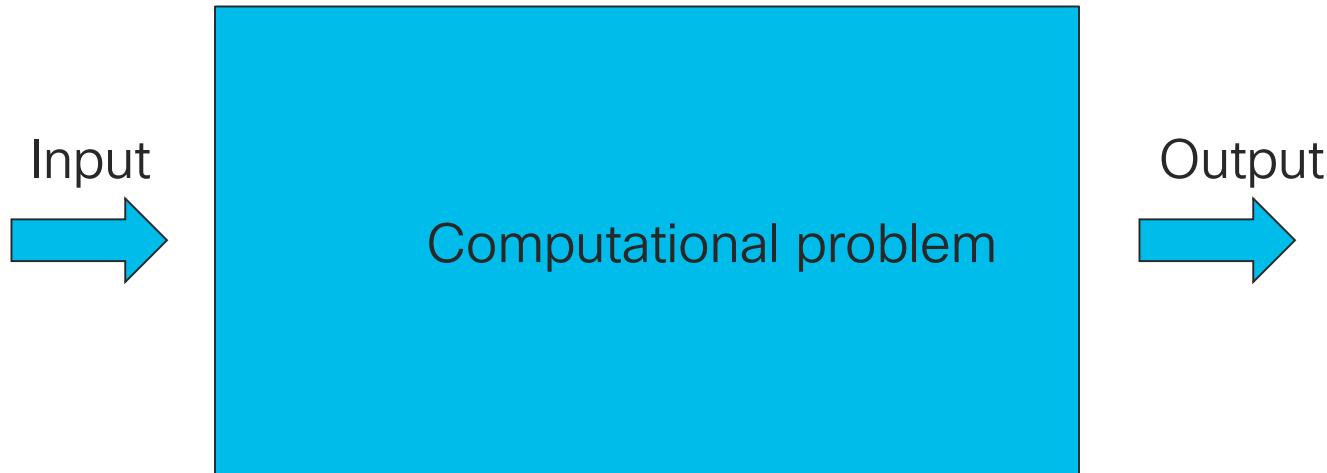

Just a bunch of servers?

The difference between
supercomputers and web farms
and database farms (and ...)

All the servers act *together* to
solve a single computational problem

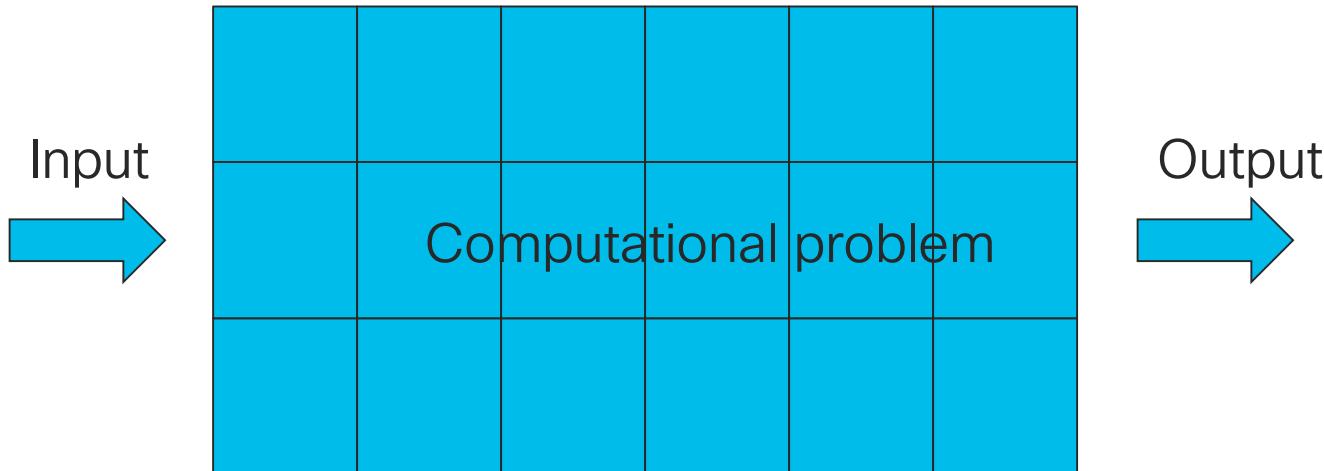

Acting together

Take your computational problem...

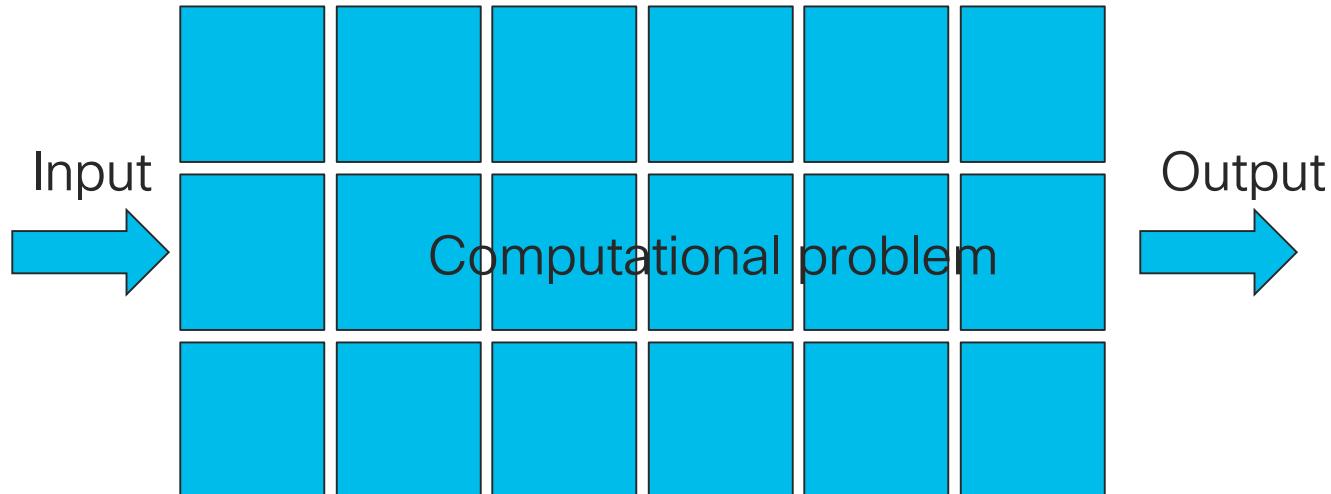

Acting together

...and split it up!

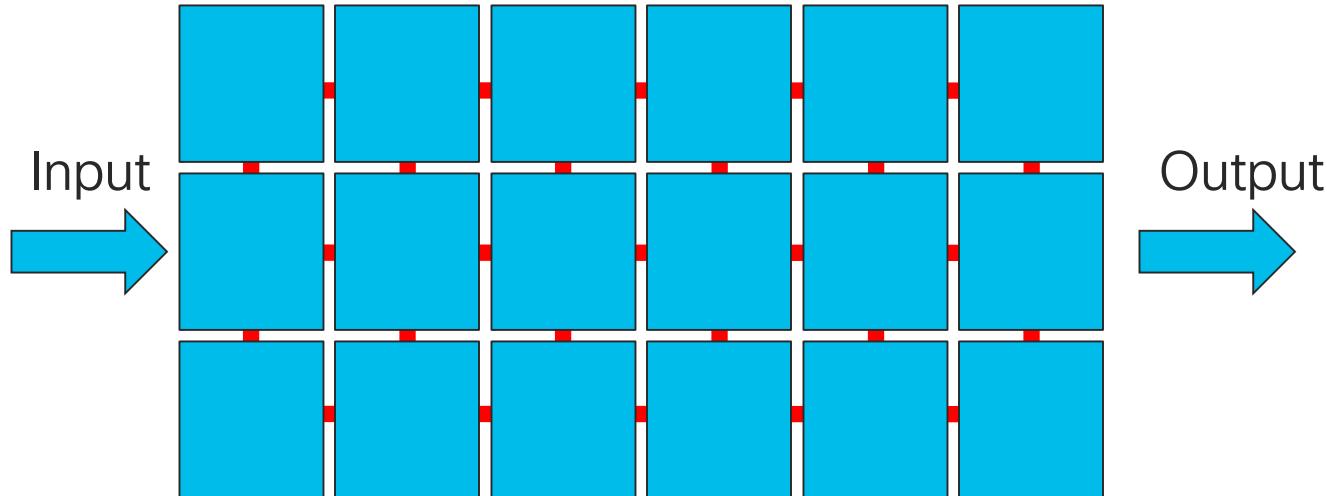

Acting together

Distribute the input data
across a bunch of servers

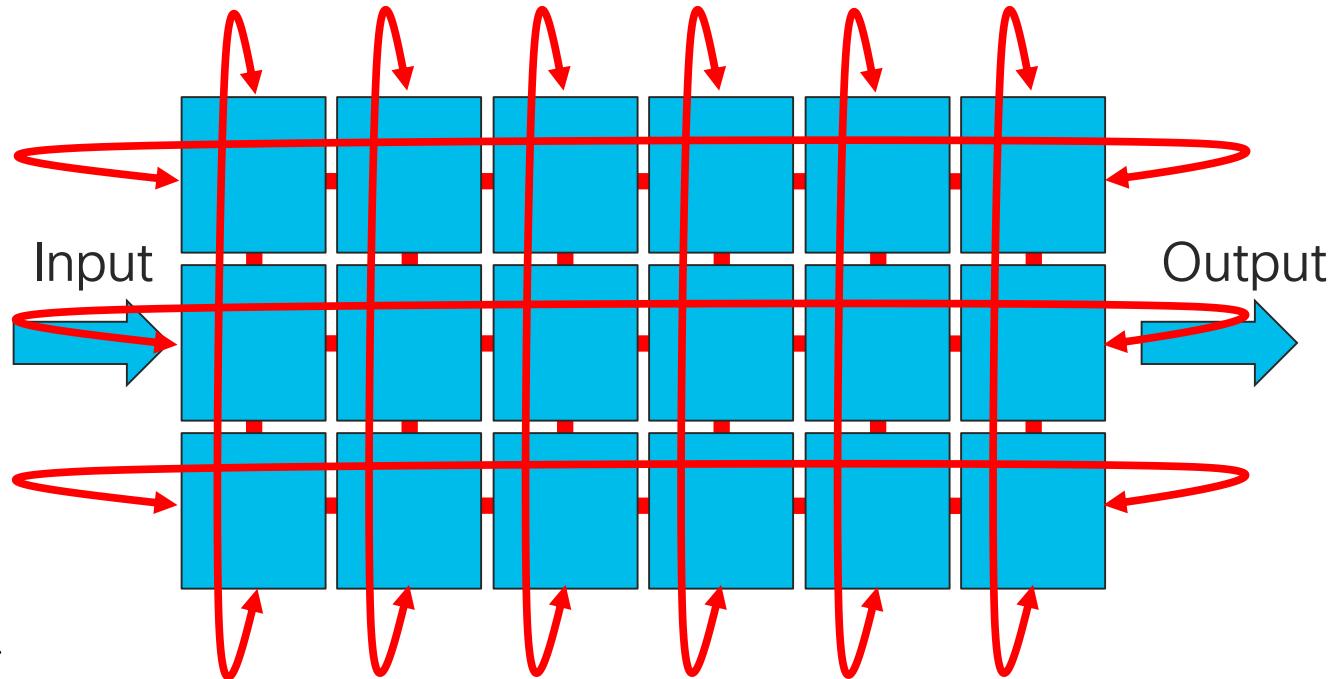

Acting together

Use the network between servers
to communicate / coordinate

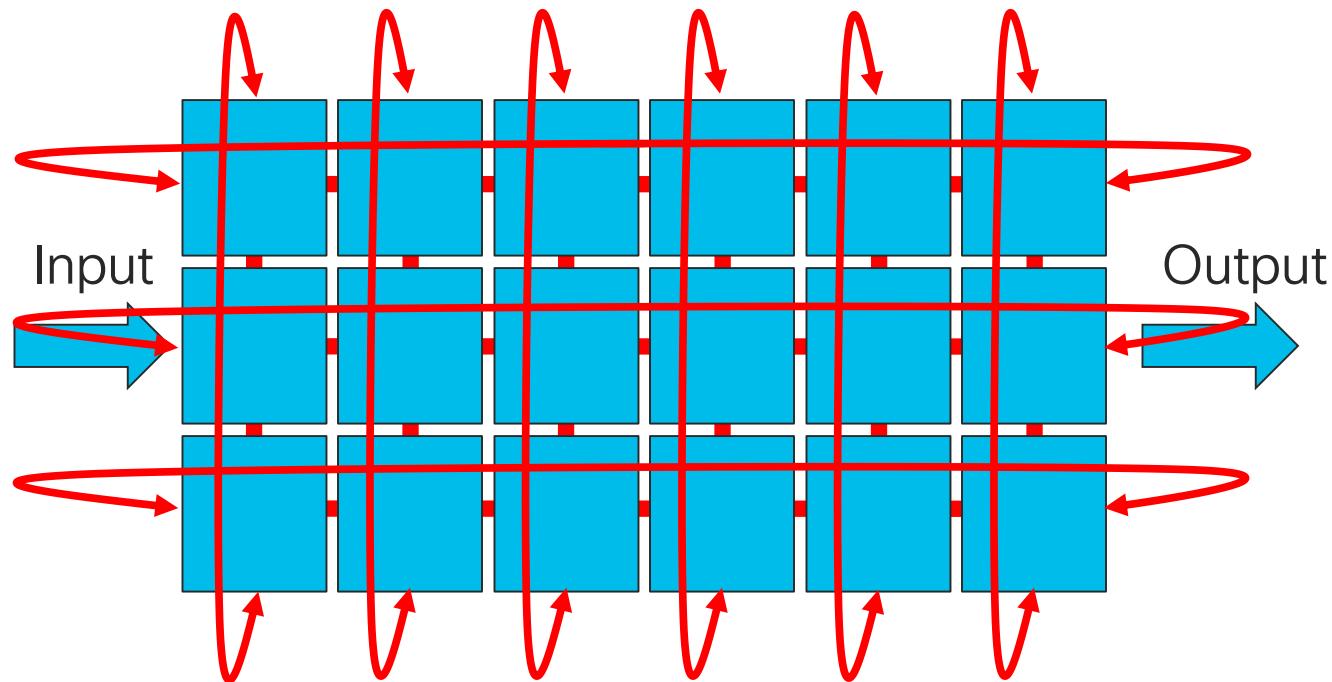

Acting together

Use the network between servers
to communicate / coordinate

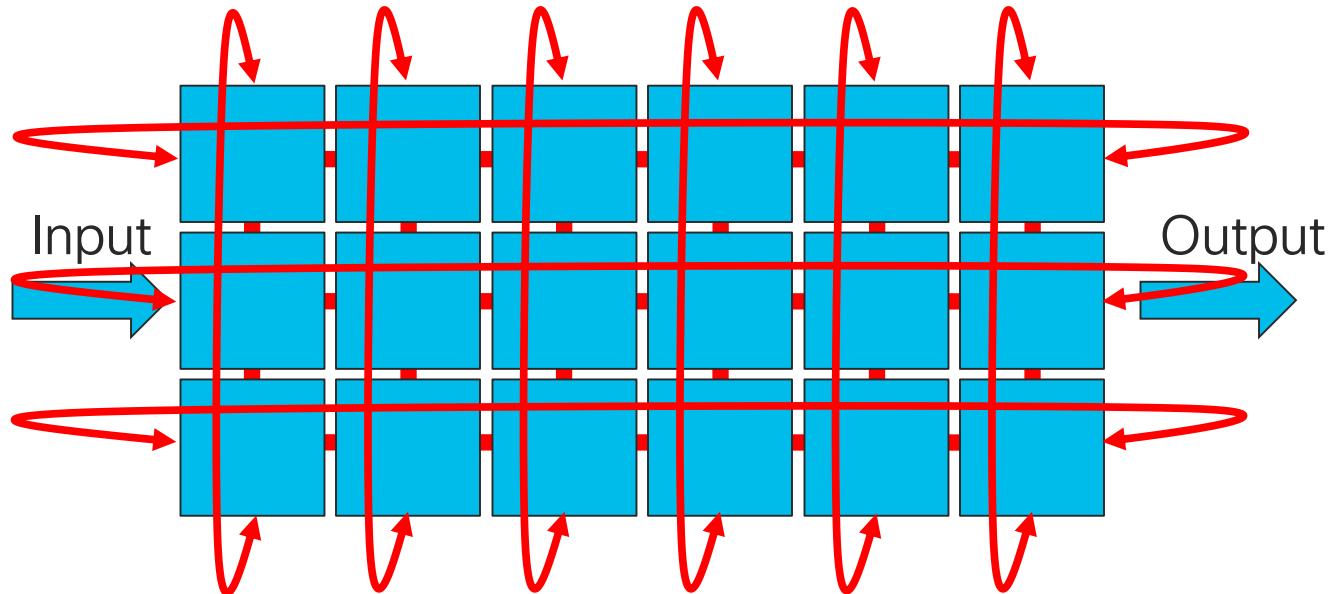

Acting together

MPI is used for this communication
(we'll get to MPI in a minute)

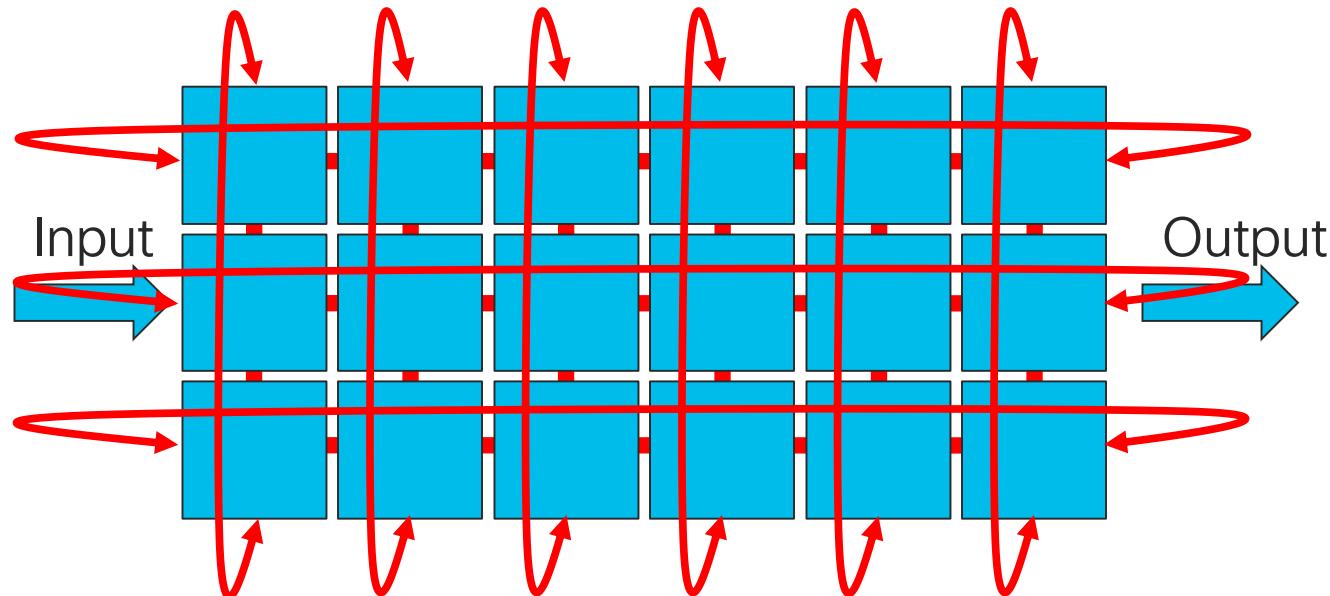

Acting together

Many small messages are exchanged
Latency of short messages is extremely important

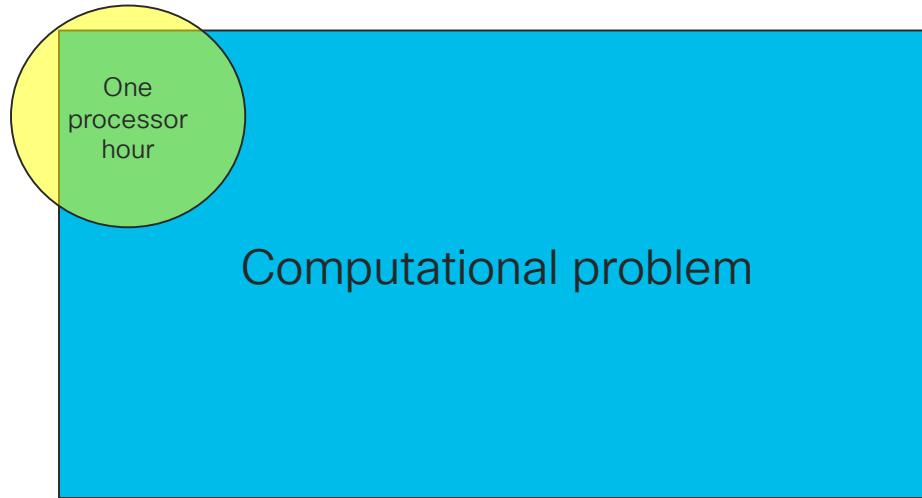

Parallel application

Individual (Linux) processes are running in parallel on each server, coordinating with each other

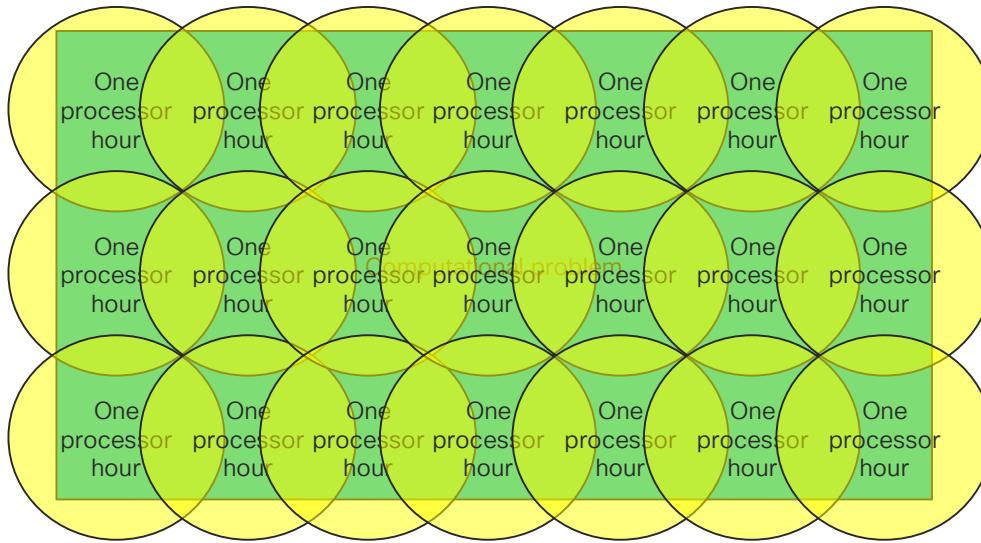

Why go to so much trouble?

1 processor = ...a long time...

Why go to so much trouble?

21 processors = ~1 hour (!)

Disclaimer: scaling is rarely perfect

High Performance Computing

HPC

=

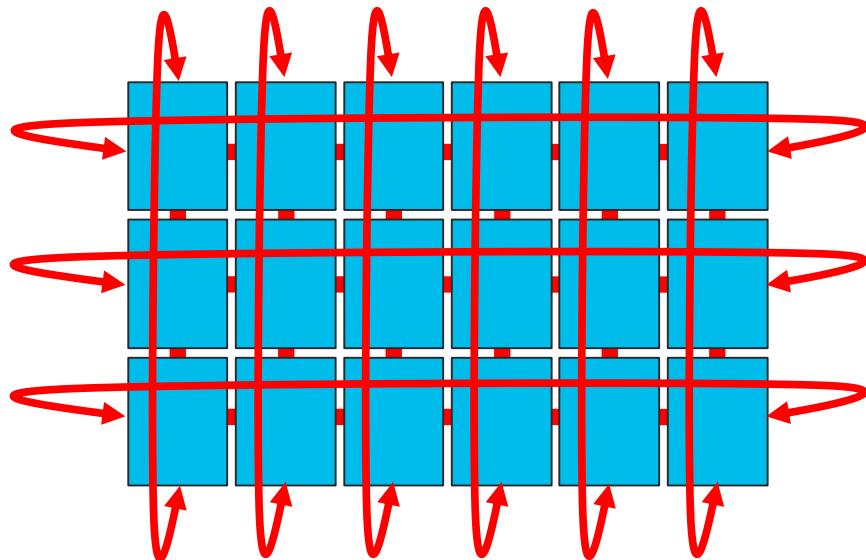

Using “supercomputers” to solve
real world problems that are
TOO BIG
for laptops, desktops,
or individuals servers

Other HPC / TC terms

Tightly coupled application

Each Linux process in the overall parallel application frequently sends short messages, usually to a small number of peer Linux processes.

Network latency -- and congestion management -- of short messages is extremely critical.

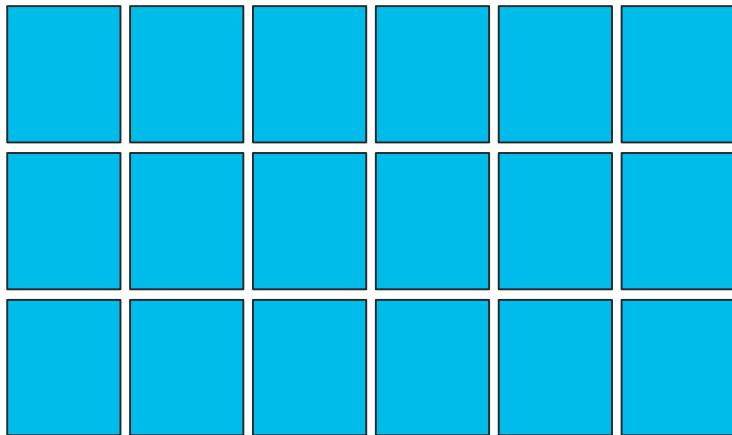

Other HPC / TC terms

Embarrassingly parallel application

The overall job is parallel, but little to no communication or coordination is required to compute the final result.

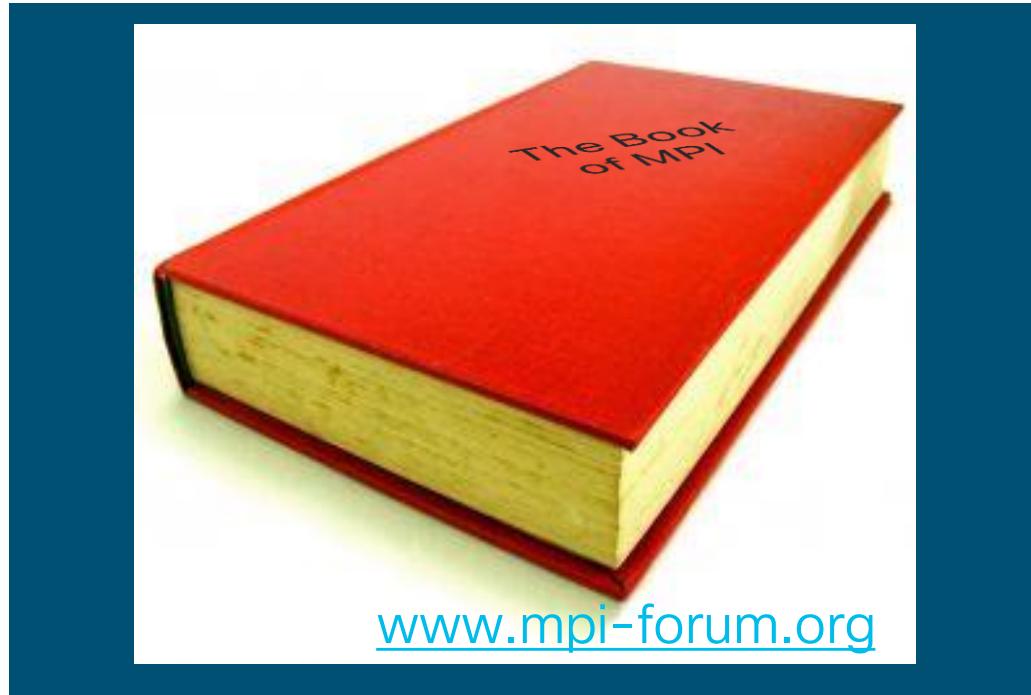

Network latency is likely not a factor. Bandwidth may or may not be, depending on the size of the input / output data sets.

What is MPI?

What is the Message Passing Interface (MPI)?

A standards document

There are many implementations
of the MPI standard

Some are
closed source

Others are
open source

They are usually comprised of
middleware and a runtime

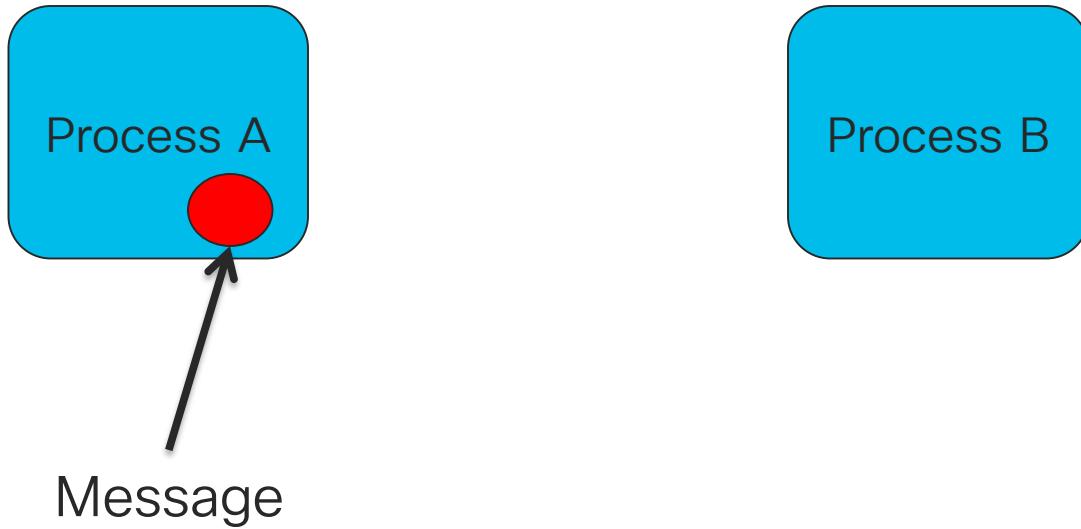

So what is MPI *for*?

Let's break it down...

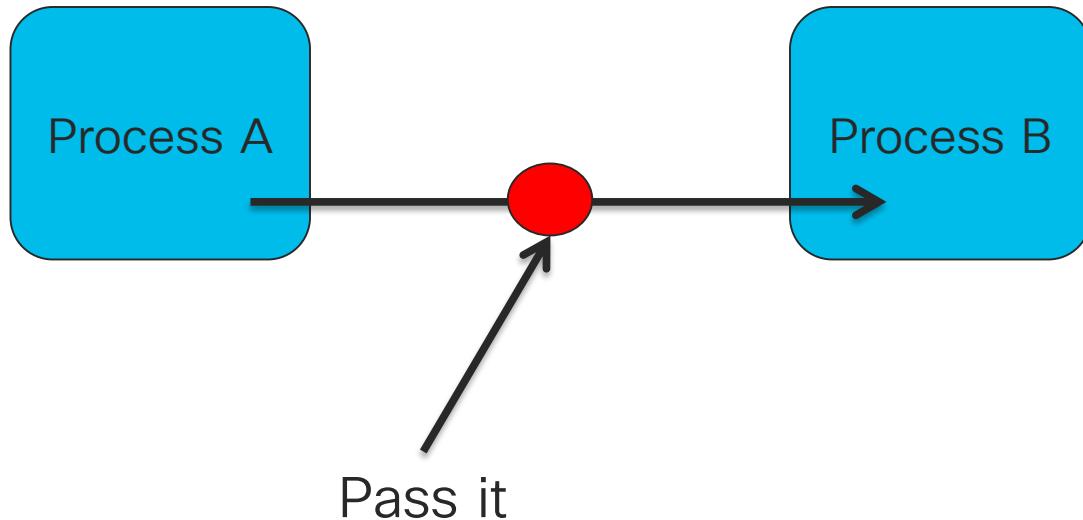

Message Passing

Interface

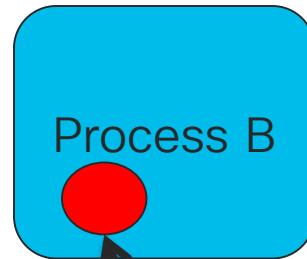

1. Message passing

1. Message passing

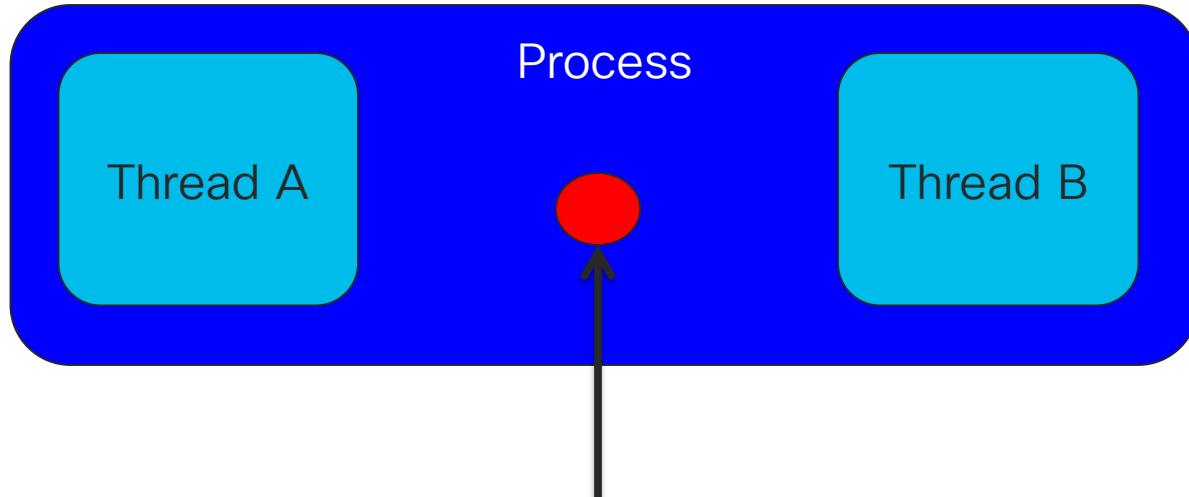

1. Message passing

Message has been passed

1. Message passing

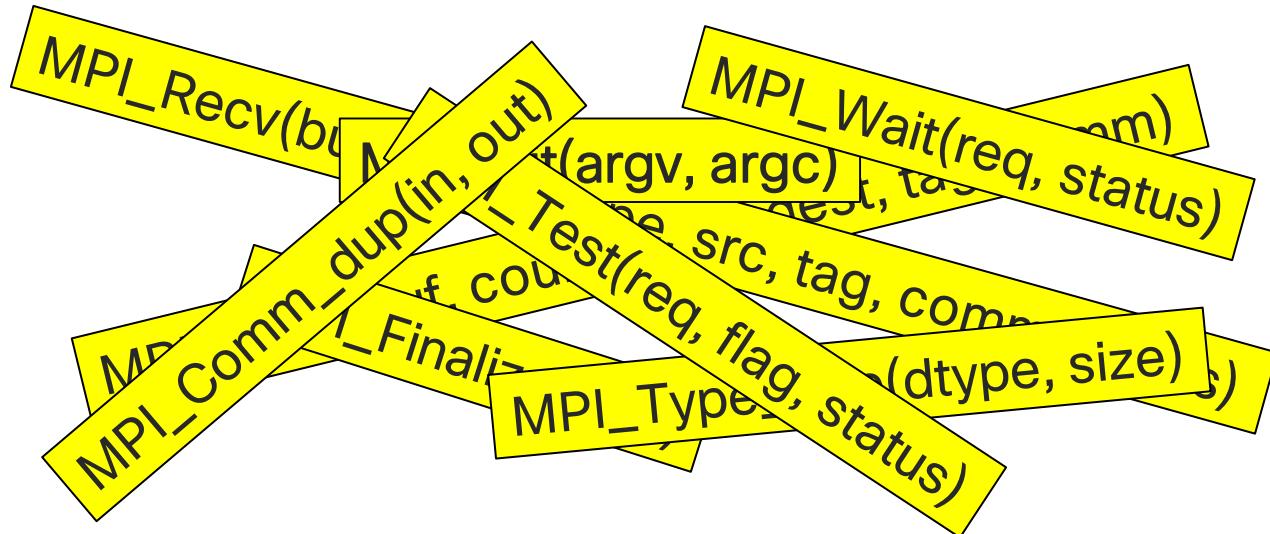

...as opposed to data that is shared

2. Interface

Fortran too!

C programming function calls

Putting it back together

Message Passing

Interface

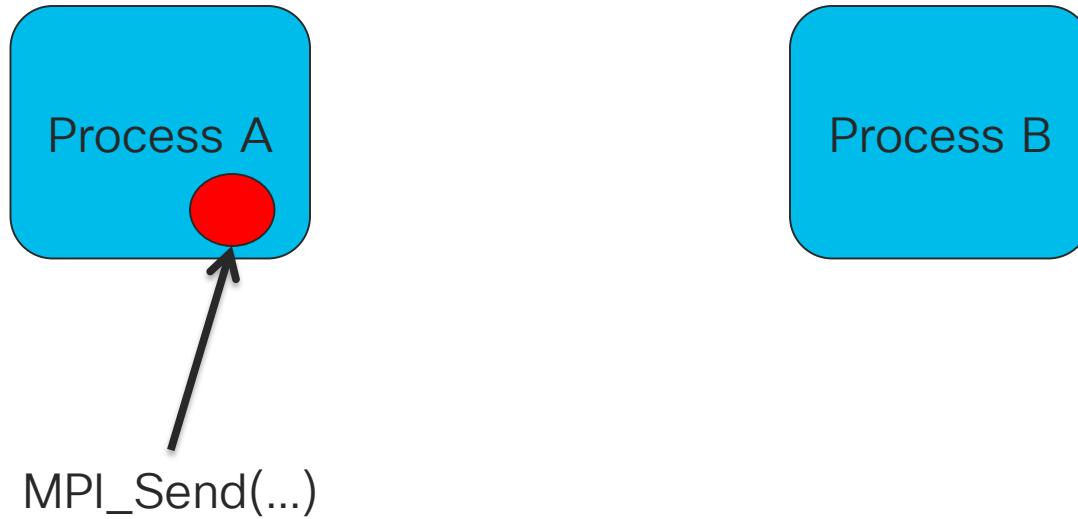

“An interface for passing messages”

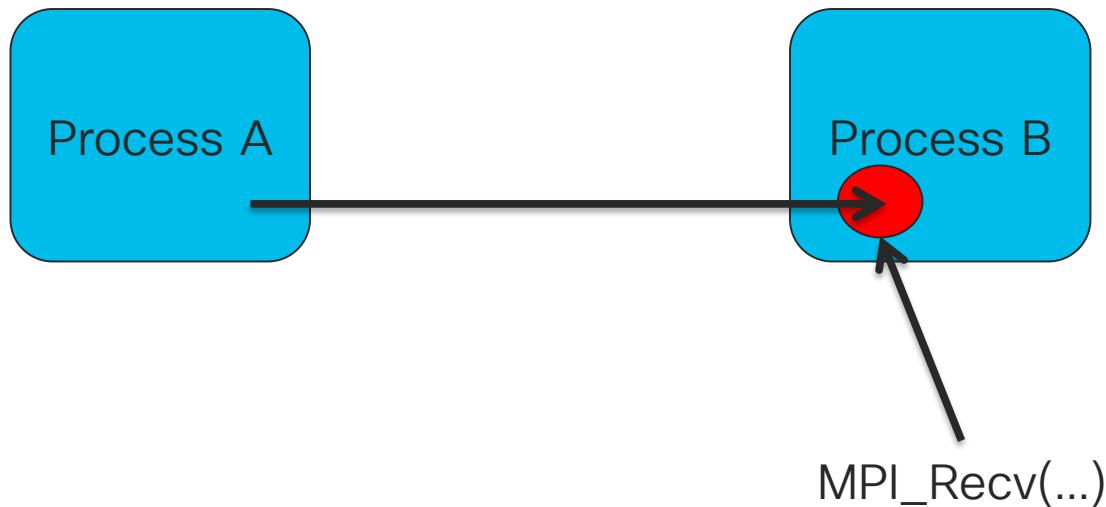

“C functions for passing messages”

Fortran too!

C/Fortran functions for message passing

C/Fortran functions for message passing

Really? Is that all MPI is?

“Can’t I just do that with sockets?”

Yes!
(...and no)

Comparison

- (TCP) Sockets
- Connections based on IP addresses and ports
- Point-to-point communication
- Stream-oriented
- Raw data (bytes / octets)
- Network-independent
- “Slow”
- MPI
- Based on peer integer “rank” (e.g., 8)
- Point-to-point and collective and one-sided and ...
- Message oriented
- Typed messages
- Network independent
- Blazing fast

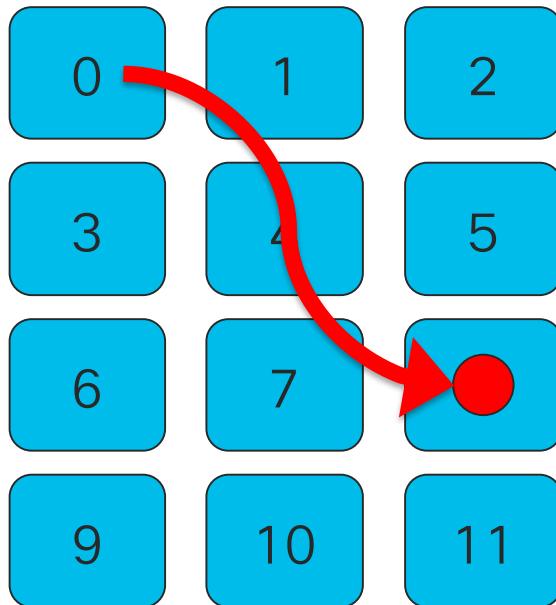

Comparison

Whoa!
What are these?

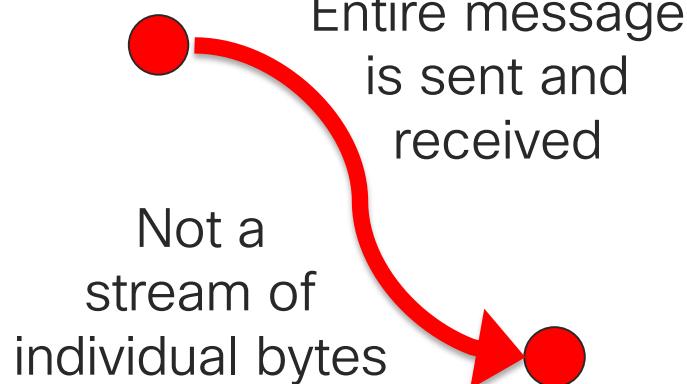

- MPI
- Based on peer integer “rank” (e.g., 8)
- Point-to-point and collective and one-sided and ...
- Message oriented
- Typed messages
- Network independent
- Blazing fast

Peer integer “rank”

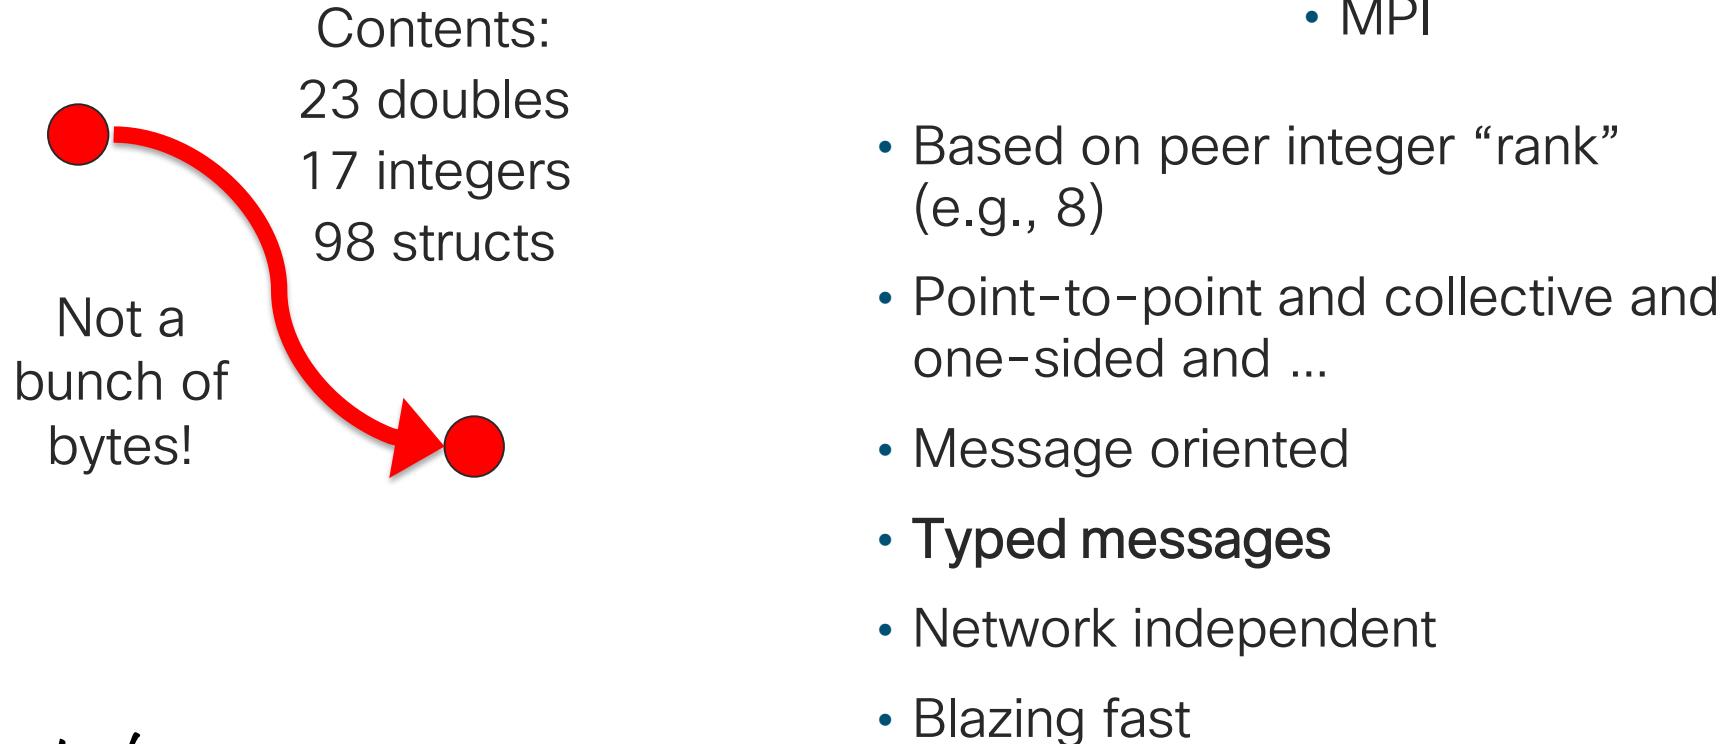

- MPI
- Based on peer integer “rank” (e.g., 8)
- Point-to-point and collective and one-sided and ...
- Message oriented
- Typed messages
- Network independent
- Blazing fast

Messages, not bytes

- MPI
- Based on peer integer “rank” (e.g., 8)
- Point-to-point and collective and one-sided and ...
- **Message oriented**
- Typed messages
- Network independent
- Blazing fast

Messages, not bytes

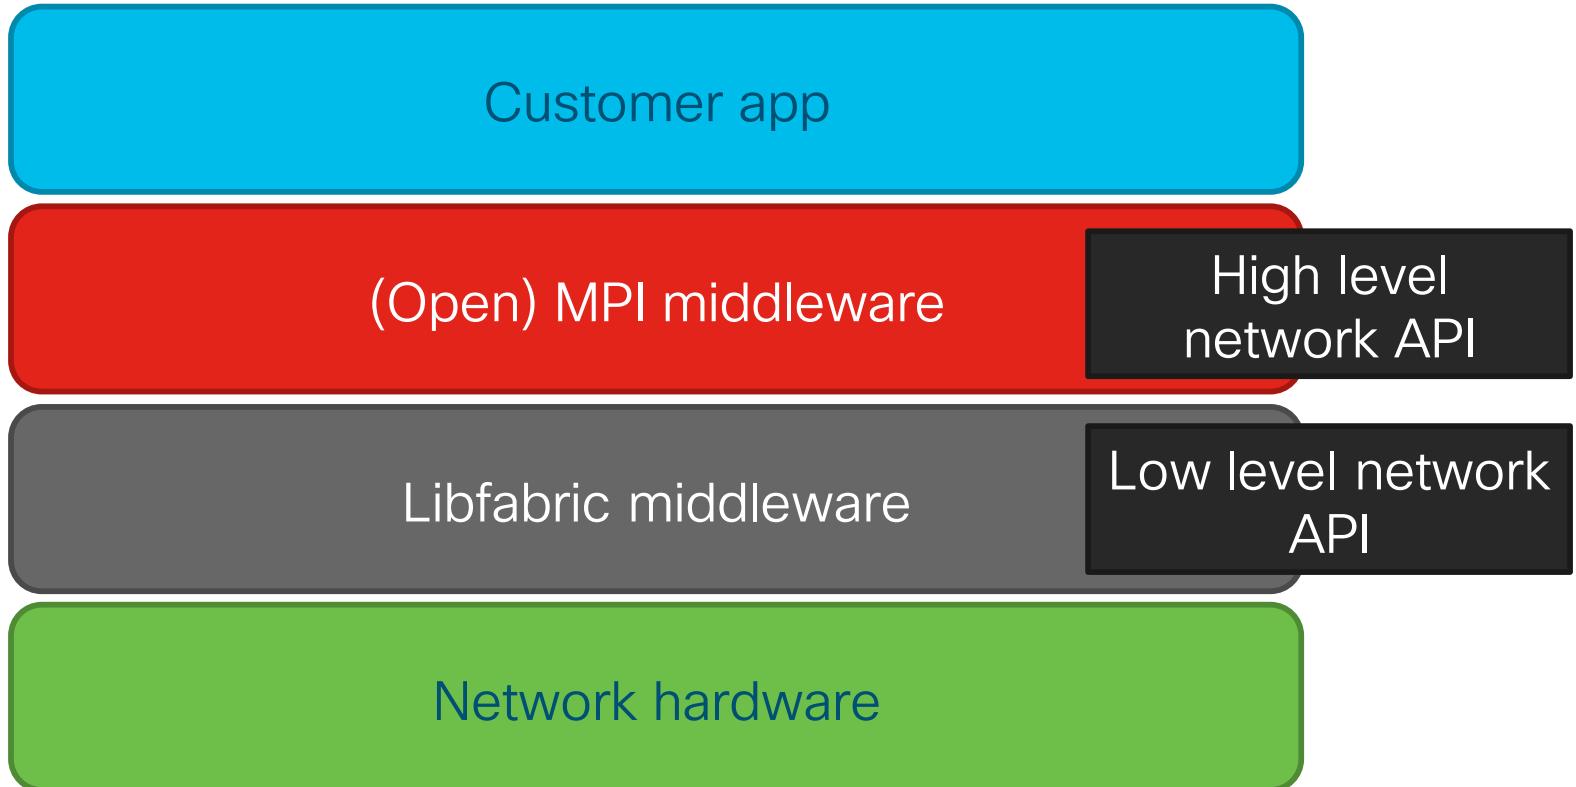

MPI is the top layer of the API stack

Customer app

(Open) MPI middleware

But there's more below that

HPC Cluster Components

Traditional HPC cluster

Head node /
ssh login
server

- Linux on bare metal
- Large RAM
- Used for interactive logins
 - Compile / build applications
 - Submit jobs
- Provides cluster job scheduler, NTP, ...etc.

Traditional HPC cluster

- Network file system
 - Possibly served from head node
 - Possibly have distinct file server(s)
 - May be traditional NFS
 - Or may be a parallel filesystem
- Available across entire cluster

Traditional HPC cluster

Head node /
ssh login
server

Shared file
storage

Compute node

Compute node

Compute node

Compute node

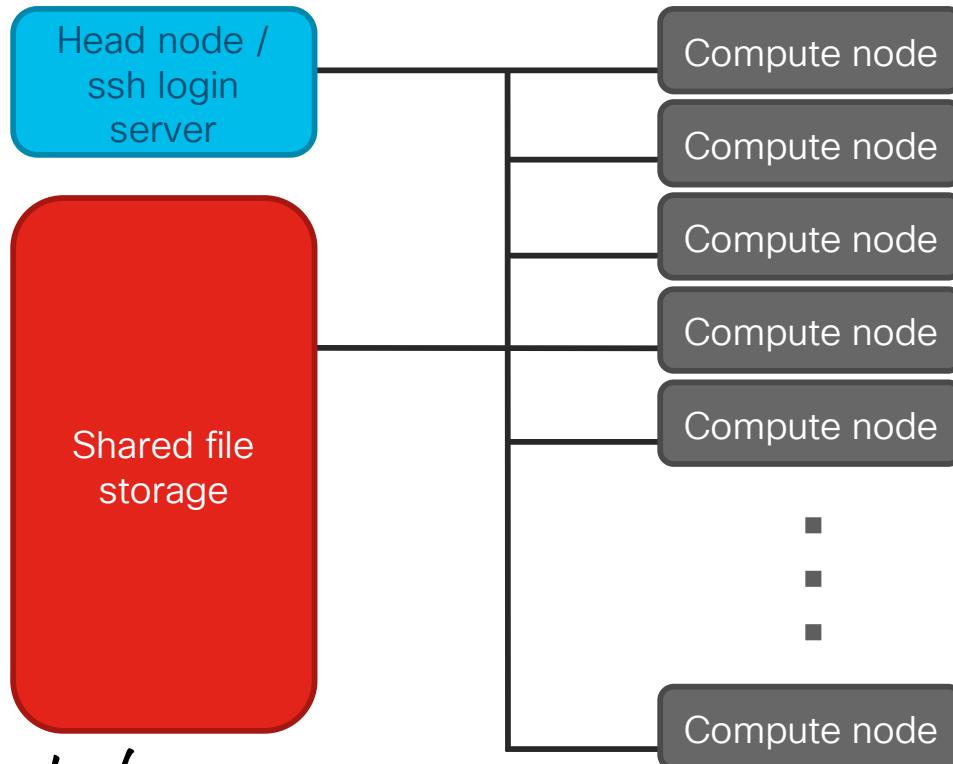

Compute node

⋮

Compute node

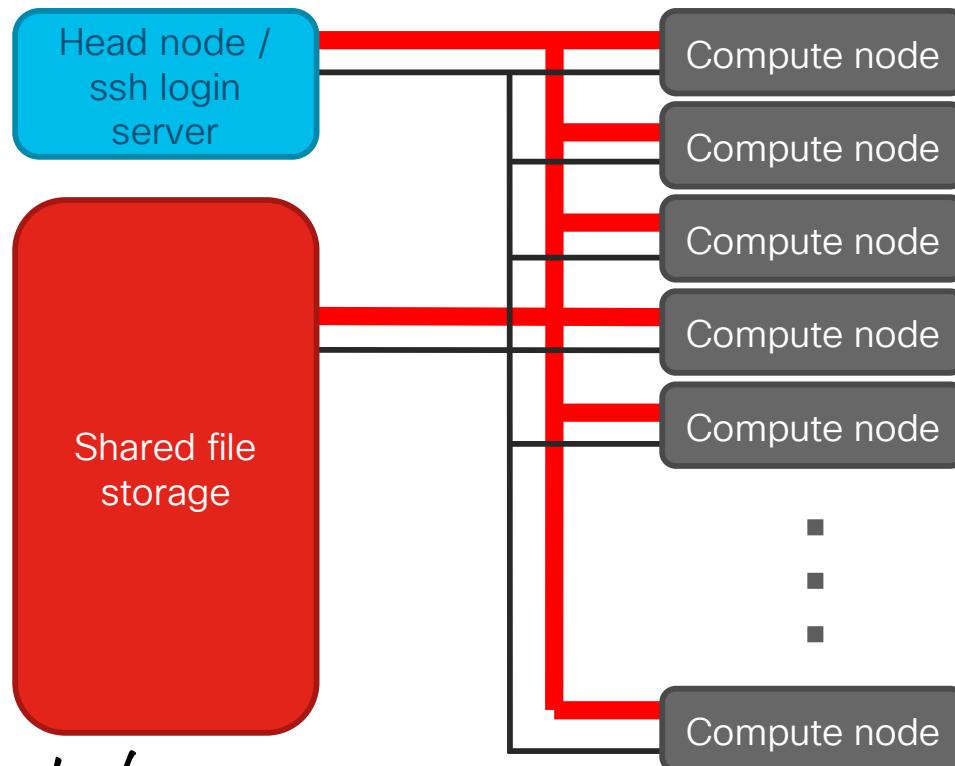

- Large number of compute nodes
- Each compute node:
 - High end Xeon processor
 - 2-8 GB RAM per core
 - Minimal local disk
 - (customers have different religions about the specifics)

Traditional HPC cluster

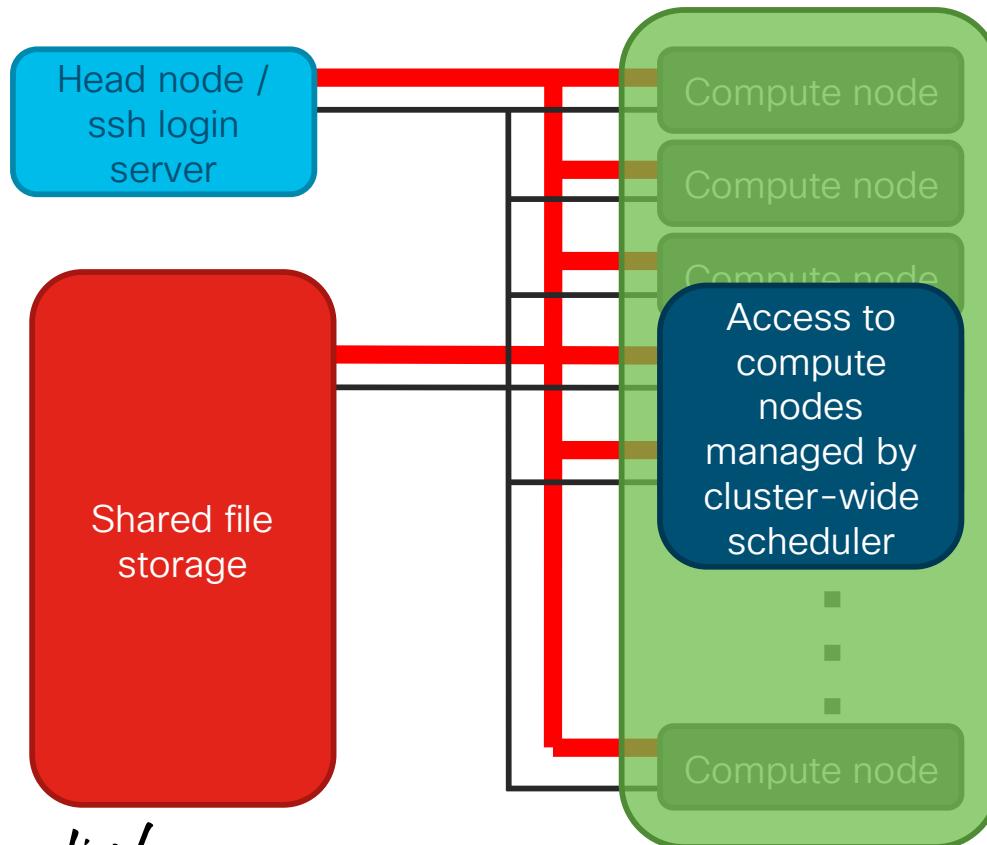

- Low end cluster
 - A single Ethernet/TCP/IP network
 - Possibly even 1 Gbps

Traditional HPC cluster

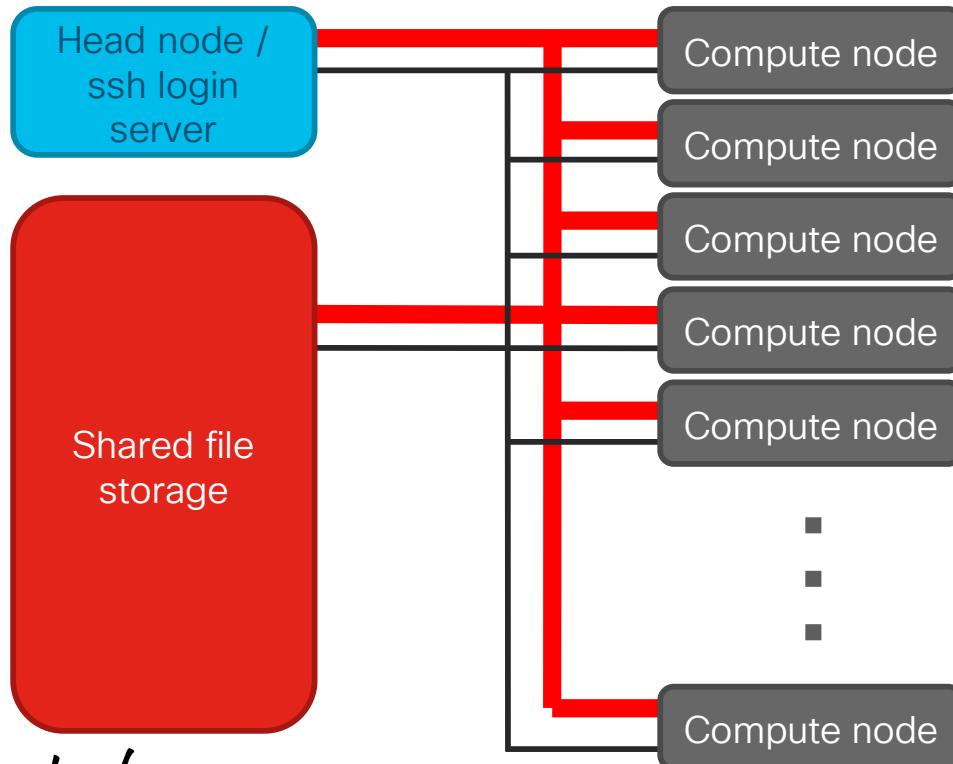

- Mid / high end cluster
 - Cheap Ethernet network for command / control (1/10/40GE)
 - Low latency network for east-west traffic, e.g., InfiniBand.

Traditional HPC cluster

- Scheduler to submit jobs
 - SLURM, LSF, Torque, PBS, ...
- OS/compute node provisioning
 - Bright, XCAT, LSF, ...
 - Some customers have home-grown solutions
 - Will NOT be virtual machines

Traditional HPC cluster

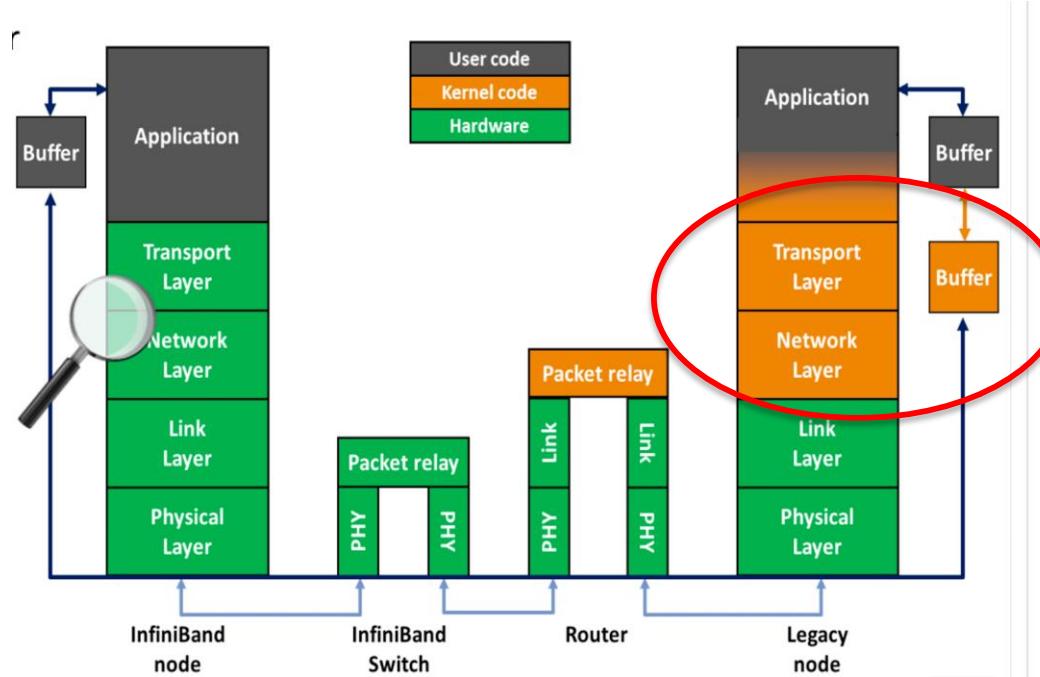

- General purpose clusters
 - Run all kinds of HPC applications
 - Usually for large institutions with many internal customers
- Specific purpose clusters
 - Run only one (or small set of) parallel application(s)
 - Usually a small set of users

HPC Fabric Types

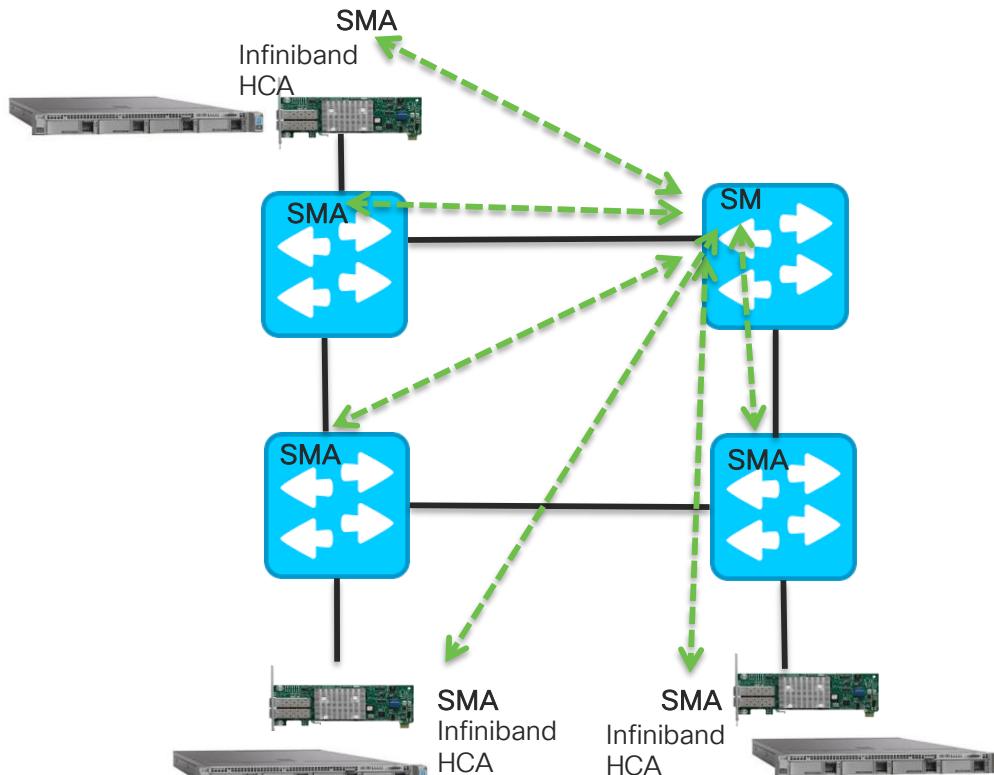

Infiniband

Infiniband Network Stack From a Host Perspective

Infiniband leverages *Kernel Bypass* for it does not use OS TCP/IP Stack.
It reduces latency.

Infiniband – Simple L2 Routing Network

Subnet Manager (SM) – Runs on switch or on server. It communicates with Subnet Manager Agents (SMA). SM can be thought as a master or a controller.

Subnet Manager Agent (SMA) – Runs on switches and HCA. And it communicates with SM. SM can be thought as SMA as slaves.

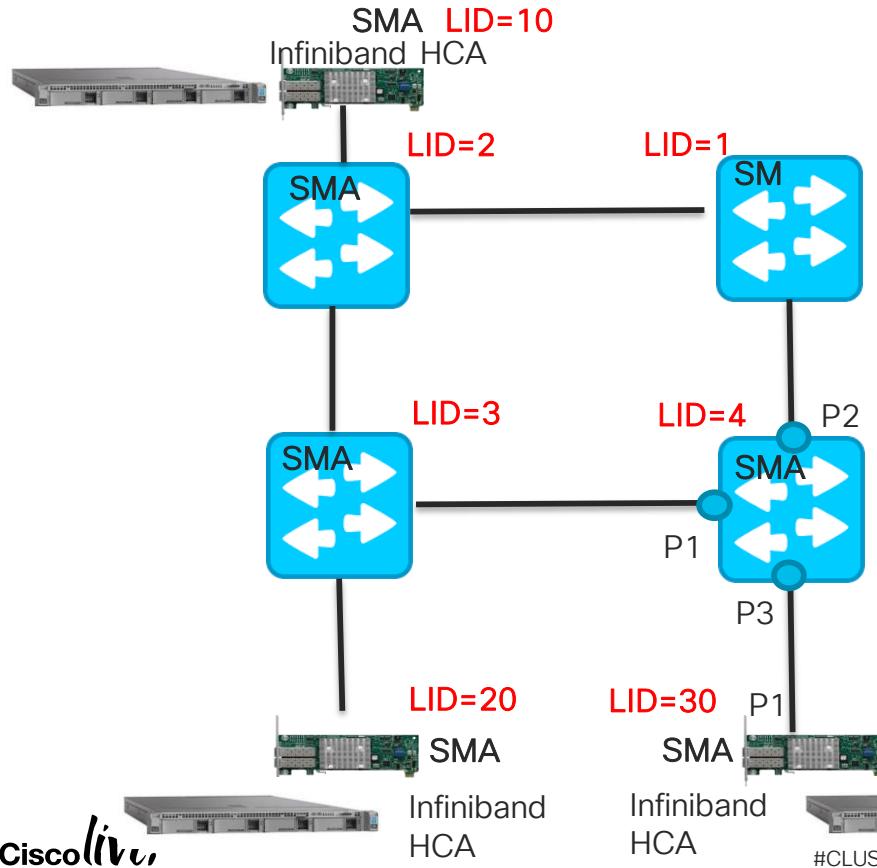

SM assigns 16 bit Link ID (LID) to all switches and Host Channel Adapters (HCA) – LID is a L2 address (think as MAC Address).

SM calculates L2 routing

Several routing algorithm available. Popular one is shortest-path routing (Dijkstra algorithm).

SM pushes the routing table to SMA.

Infiniband – Sample Routing

Routing Table		
Destination LID	Output Port	
10	P1, P2	
20	P1	
30	P3	

Routing Table		
Destination LID	Output Port	
*	P1	

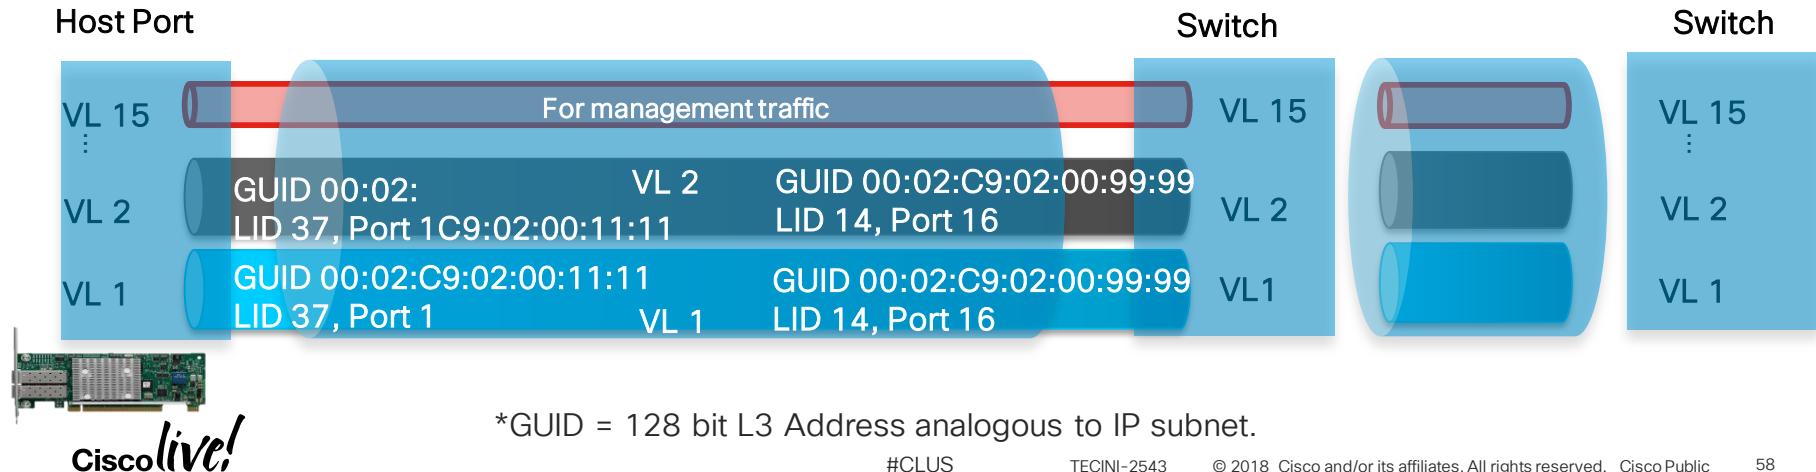

Infiniband Network QoS

Virtual Lanes

- Each Virtual Lane uses different buffers to send its packet toward the other side.
- VL 15 is Subnet Manager (mgmt) traffic only
- VL 0-7 are used for traffic

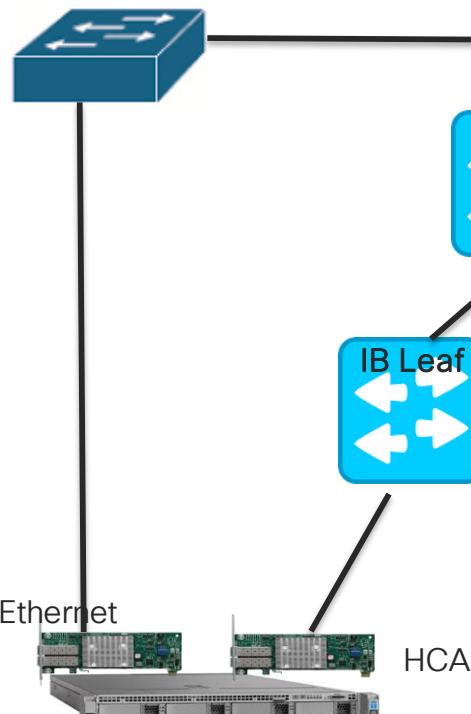

Credit Based Flow Control

- Receiver calculates credit limit sends the info to the Transmitter.
- Transmitter only transmit packets if there are enough credit limits to the packets it can send.

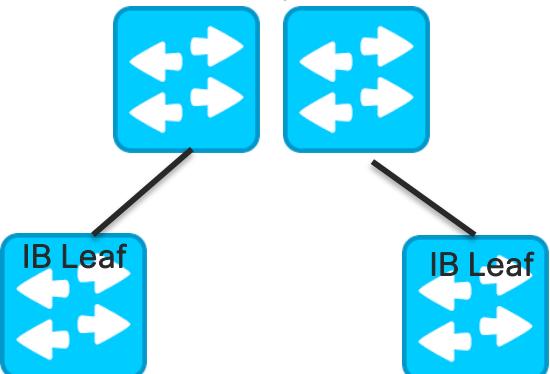

Typical Infiniband Network

Ethernet Management SW

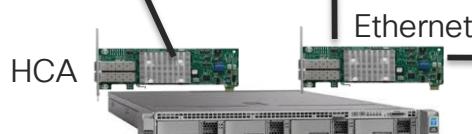

IB Spine

Cluster Head/Login Nodes

Ethernet Management SW

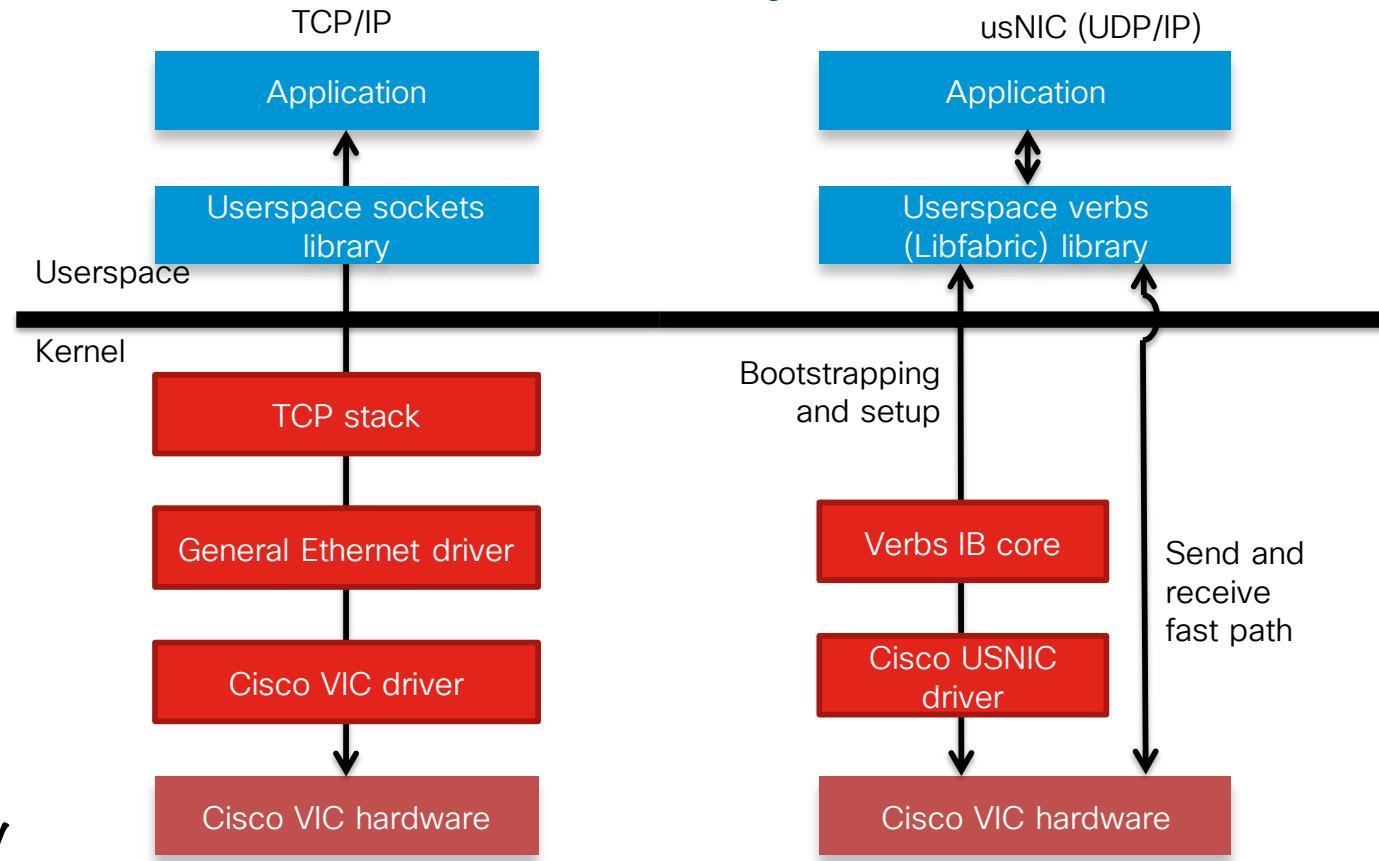

Ethernet Network for OS Management via TCP/IP
Additional server management for CIMC is typical as well

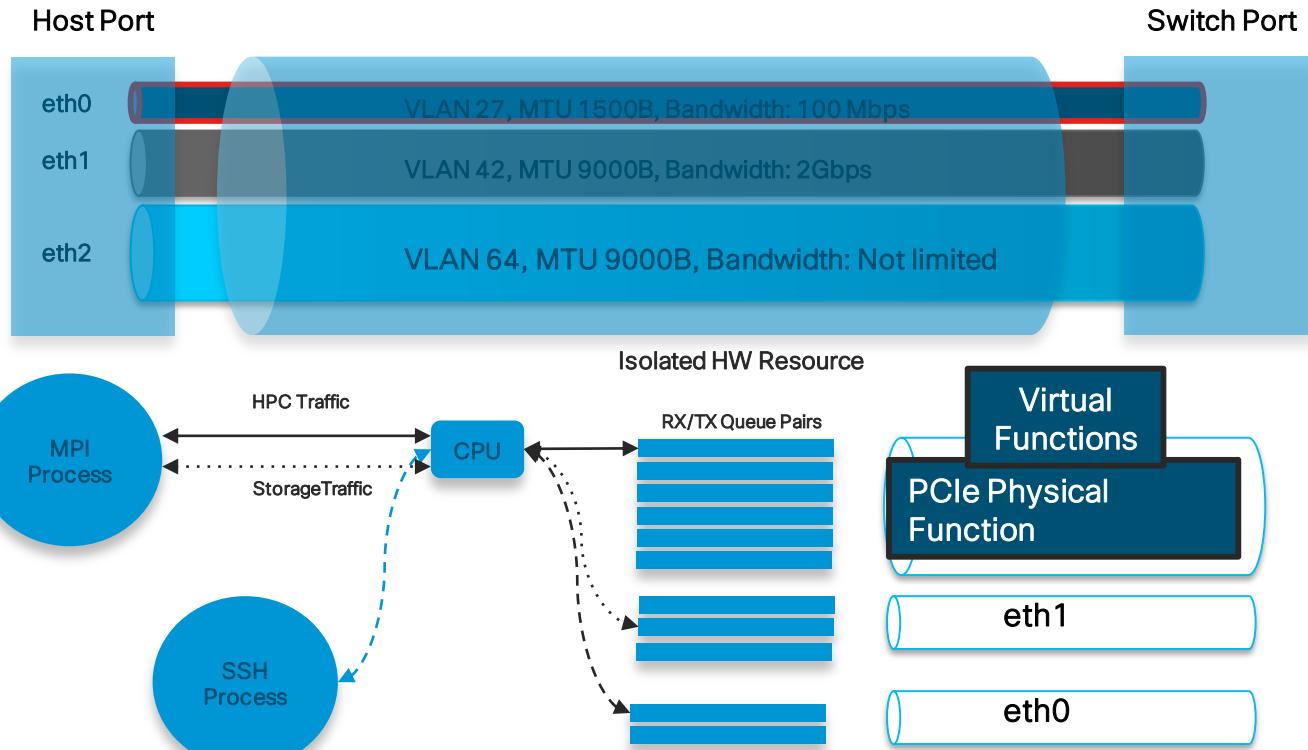

Ethernet is Here

- Ethernet is most widely used L2 Technology - networking can be managed by IT group.
- Ethernet is growing rapidly with many options (1/10/25/40/50/100G) - Infiniband vendors expanding Ethernet solutions
- More and more ultra-low latency Ethernet NICs and switches options are available
- Most Ethernet switches use store and forward operation. For low latency cut-through switching is employed.
- Ethernet in HPC fabric typically means “TCP/IP” thus “slow”.

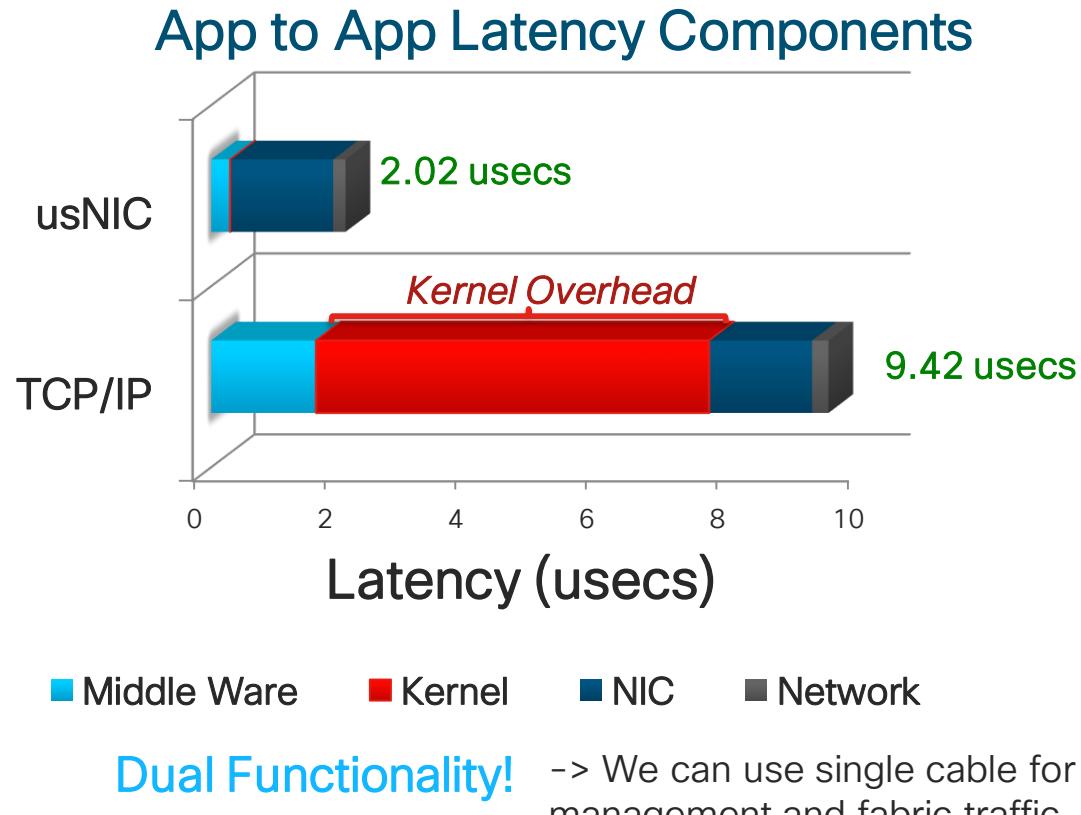

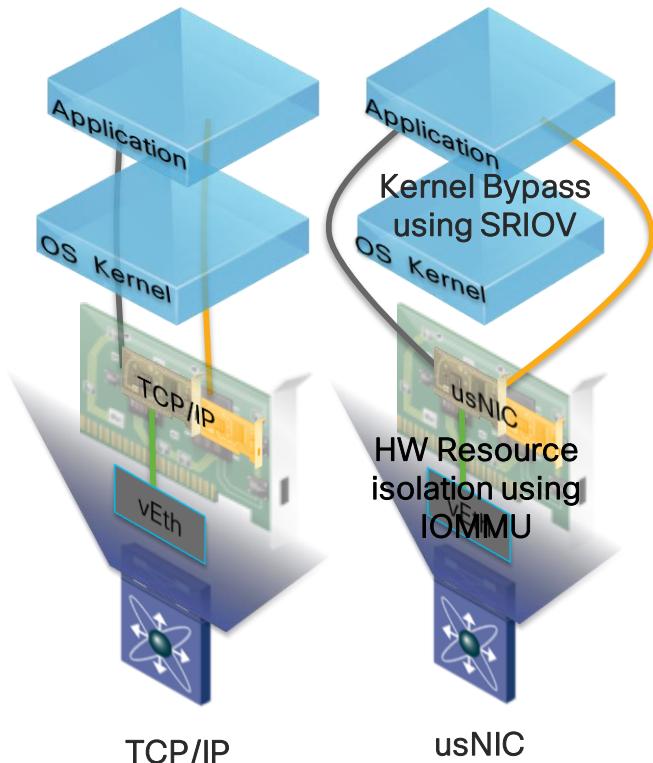

Cisco Ethernet/usNIC OS bypass

usNIC Network QoS

App to App Latency Factors

Networking Latency Comparison

Cisco C-Series vs. B-Series

	C-Series with Nexus 3548	C-Series with Nexus 9k	B-Series with UCS 62xx
User Application		630 ns	
Open MPI		Each PCIe Gen2 link traverse imposes a minimum of 90 nsecs latency	
UD libfabric usNIC		Each Main Memory access imposes a minimum latency of 80 nsecs for local memory and ~ 120 nsecs for remote memory	
VIC Hardware		Most of the latency in this layer comes from system delays related to DMA transactions	
Cisco Nexus	190 ns	450 ns	3500 ns

RDMA over Converged Ethernet (RoCE)

*Existing Infiniband based HPC applications do not need modifications

Customer app

MPI middleware

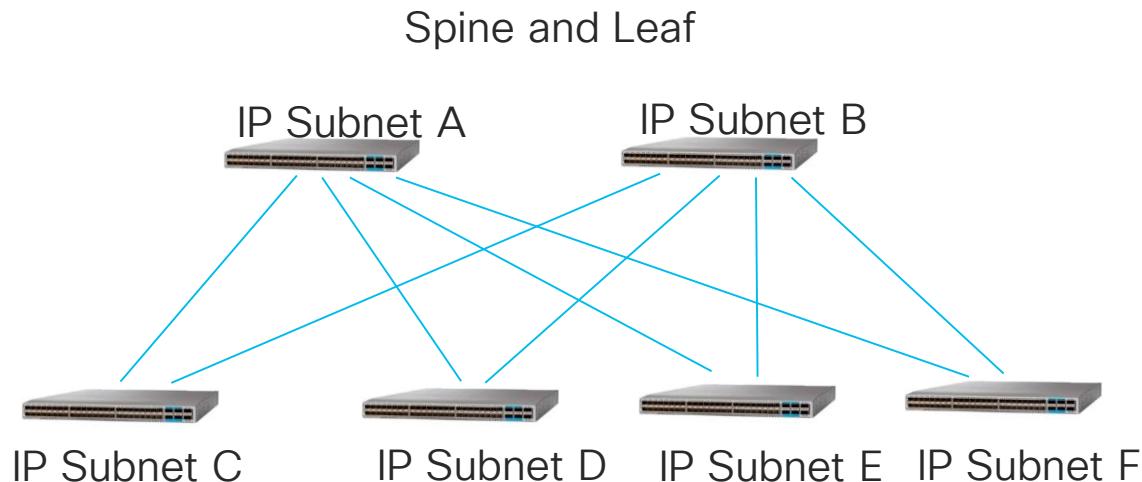

Open Fabric Enterprise Distribution

Network hardware/Ethernet

RDMA supports [zero-copy](#) networking by enabling the [network adapter](#) to transfer data directly to or from application memory, eliminating the need to copy data between application memory and the data buffers in the operating system.

The RoCEv2 protocol exists on top of either the UDP/IPv4 or the UDP/IPv6 protocol.[\[2\]](#) The UDP destination port number 4791 has been reserved for RoCE v2.[\[10\]](#) Since RoCEv2 packets are routable the RoCE v2 protocol is sometimes called Routable RoCE[\[11\]](#)

What is RoCE v2

*Because RoCE v2 is IP routable, the topology can be fully meshed.

Nexus PFC Support for RoCE

```
switch (config)# interface Ethernet1/1
switch (config-if)# flowcontrol receive on
switch (config-if)# flowcontrol send on
switch (config)# interface Ethernet1/1
switch (config-if)# flowcontrol receive on
switch (config-if)# flowcontrol send on
switch (config)# class-map type qos RDMA      <-- RDMA is just the name of the class
switch (config-cmap-qos)# match cos 0        <-- Classify all traffic with CoS 0, in this case untagged traffic.
switch (config-cmap-qos)# exit
```

Nexus PFC Support for RoCE

```
switch (config)# policy-map type network qos QOS_NETWORK
```

<-- QOS_NETWORK is just the name of the policy

```
switch (config-pmap-nqos)# class type network-qos RDMA
```

<-- Use the RDMA class as the traffic that will be policed in this case.

```
switch (config-pmap-nqos-c)# pause pfc-cos 0
```

<-- Pause all classified traffic that has CoS 0

```
switch (config-pmap-nqos-c)# exit
```

```
switch (config-pmap-nqos)# exit
```

```
switch (config)# system qos
```

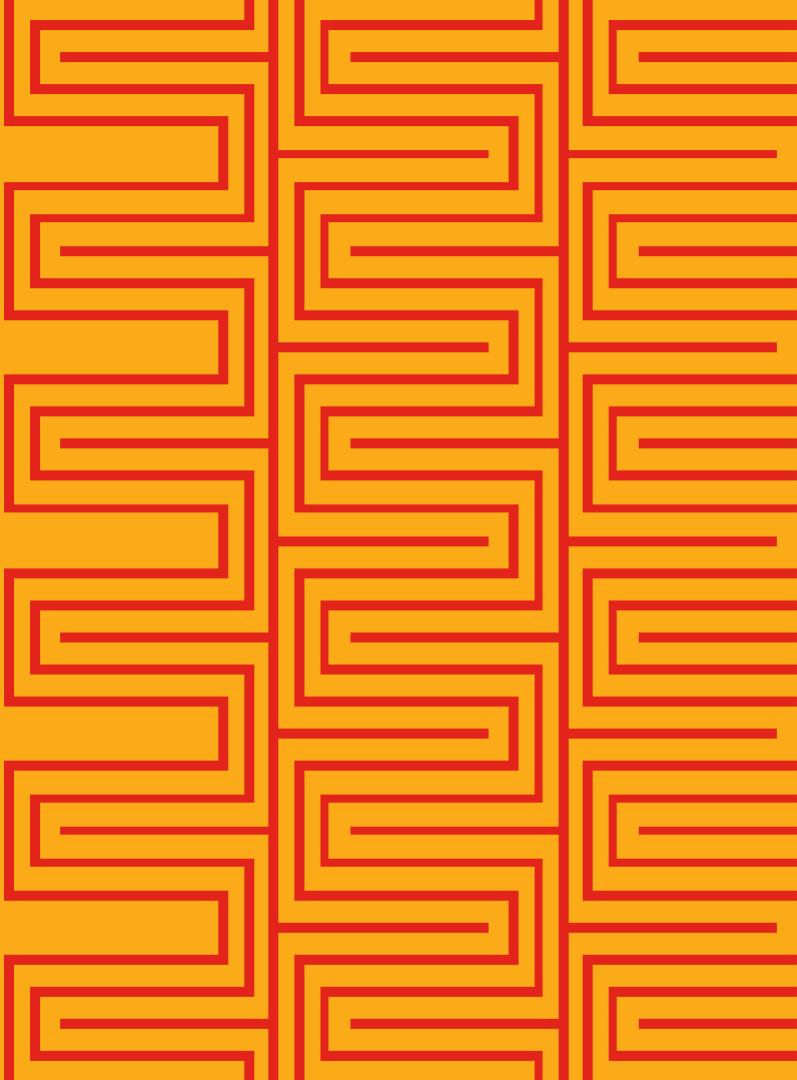

```
switch (config )# service-policy type network-qos QOS_NETWORK
```

<-- Apply QOS_NETWORK policy to the switch (all ports)

Servers

Unified Computing Systems

M5 – Blade Servers

UCS B200 M5

Ideal for Bare Metal Enterprise, VDI, or Dense Virtualization/ Consolidation Workloads

Up to two Intel Xeon Processor Scalable Family (Max: 56 Cores total)

24 DIMMs, up to 3TB

Up to 80 Gbps I/O

Up to 2 NVIDIA P6 GPUs

Up to 2 SD/M.2 cards

Up to 2 SFF HS drives

UCS B480 M5

High Performance Platform designed for Compute-Intensive and Memory-Intensive Enterprise Workloads

Up to four Intel Xeon Processor Scalable Family (Max: 112 Cores total)

48 DIMMs, up to 6TB

Up to 160 Gbps I/O

Up to 4 NVIDIA P6 GPUs

Up to 4 SD/M.2 cards

Up to 4 SFF HS drives

Unified Computing Systems

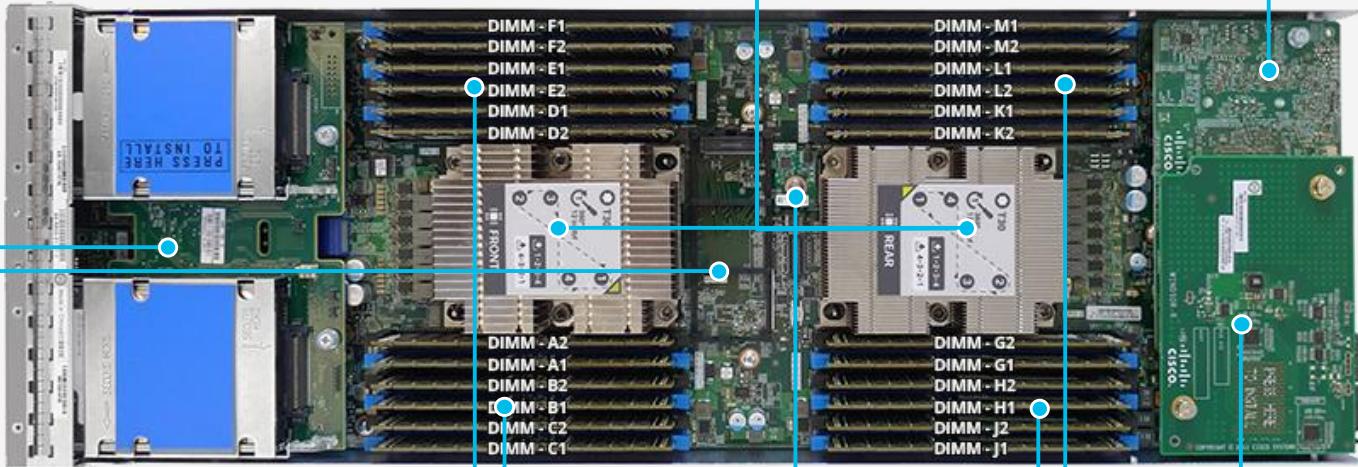

B200 M5

1x front
mezzanine slot:
Choice of RAID
controller and drive
cage or **front GPU**

Modular SD
or M.2

Two Intel® Xeon® Scalable processors

VIC mLOM dedicated slot

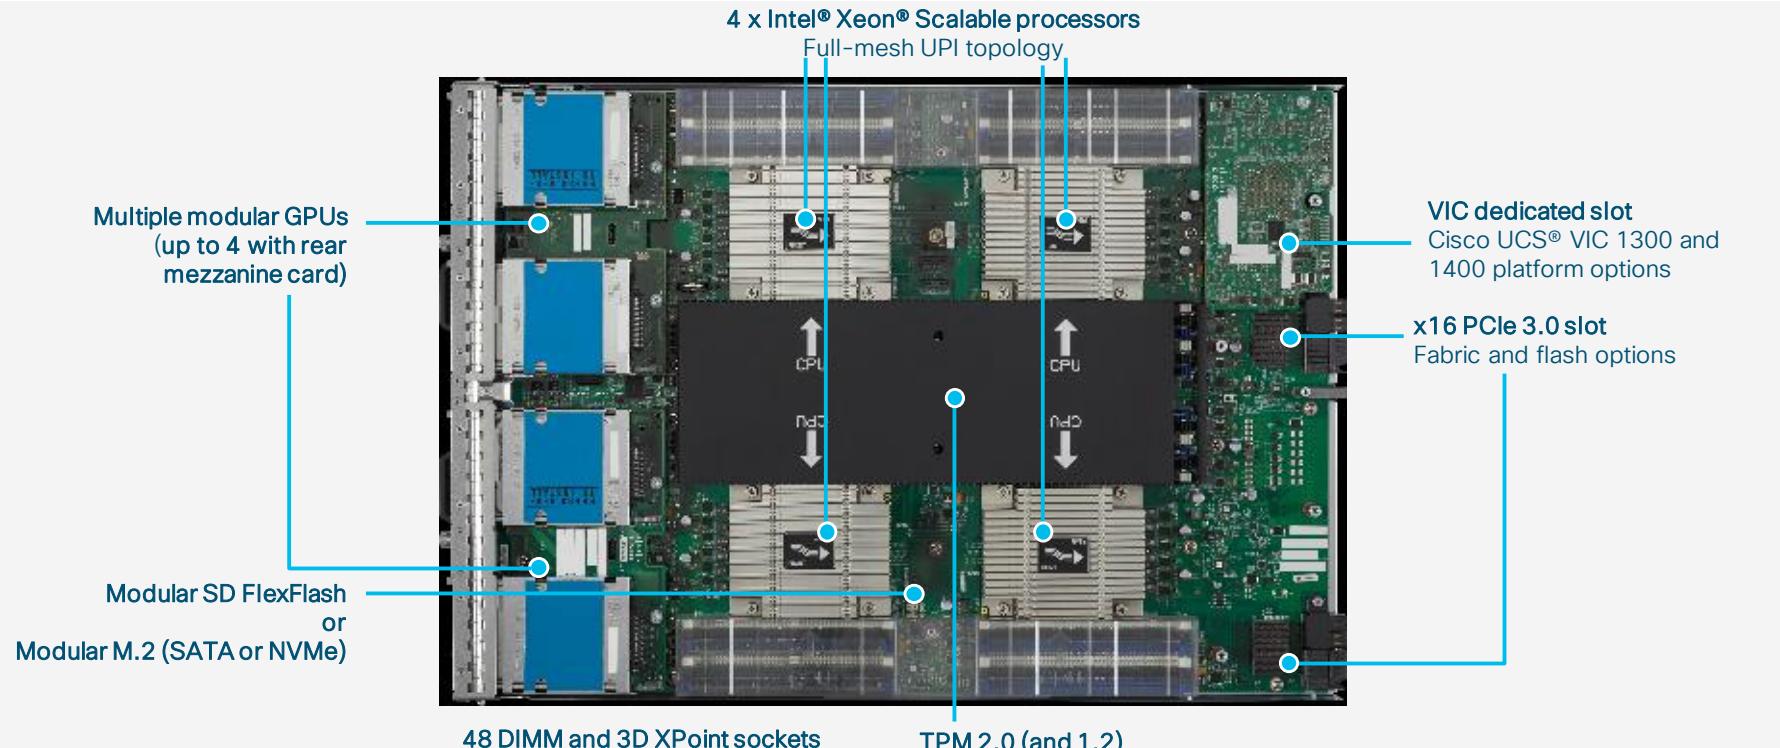

TPM 2.0 (and 1.2)

24 DIMMs (3D XPoint ready)

1x rear mezzanine slot x16
PCIe 3.0:
Choice of VIC expander,
VIC mezzanine card, flash
storage, or **rear GPU**

Unified Computing Systems

B480 M5

UCS Rack Servers

M5 – C-Series

UCS C220 M5

Optimal performance in a dense 1RU form factor for a wide range of workloads including virtualization, web, collaboration, cloud, and bare metal applications

Up to two Intel Xeon Processor Scalable Family (Max: 56 Cores total)

24 DIMMs, up to 3TB

10 SFF or 4 LFF HS drives, NVMe PCIe SSD support

2 PCIe 3.0 x16 slots Support for 1 NVIDIA P4 GPU

UCS C240 M5

Optimal performance for a wide range of enterprise workloads including big data analytics, collaboration, databases, virtualization, and high performance applications

Up to two Intel Xeon Processor Scalable Family (Max: 56 Cores total)

24 DIMMs, up to 3TB

24 SFF or 12 LFF HS drives, NVMe PCIe SSD support, 2 rear SFF HD drives

6 PCIe 3.0 slots Support for 2 NVIDIA P100/V100 GPUs

UCS C480 M5

Designed for the most demanding server workloads such as in-memory database, EDA, Machine Learning, Data Analytics, and CPU / GPU rendering

Up to **FOUR** Intel Xeon Processor Scalable Family (Max: 112 Cores total)

48 DIMMs, up to 6TB

24 SFF HS drives, NVMe PCIe SSD support, 8 internal top loaded SFF drives

12 PCIe 3.0 slots Support for 6 NVIDIA P100/V100 GPUs

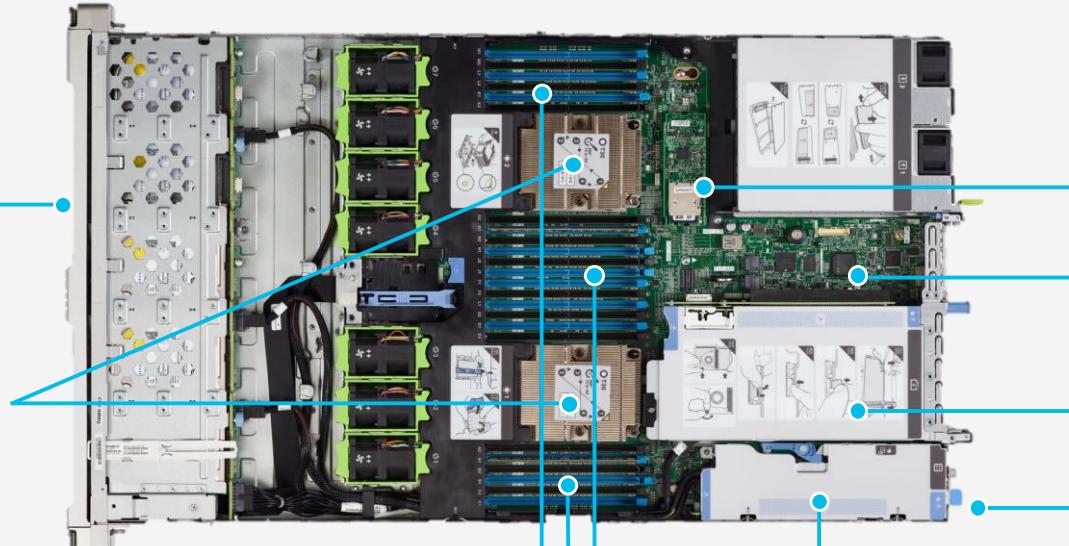

Unified Computing Systems

C220 M5

Up to 10 SFF or 4 LFF drives

Support for 2 NVMe PCIe SSDs in mixed configuration, or up to 10 NVMe PCIe SSDs with NVMe-optimized SKU

2 x Intel® Xeon® Scalable processors

24 DIMM sockets
Up to 2666 MHz

Dedicated RAID slot

Unified Computing Systems

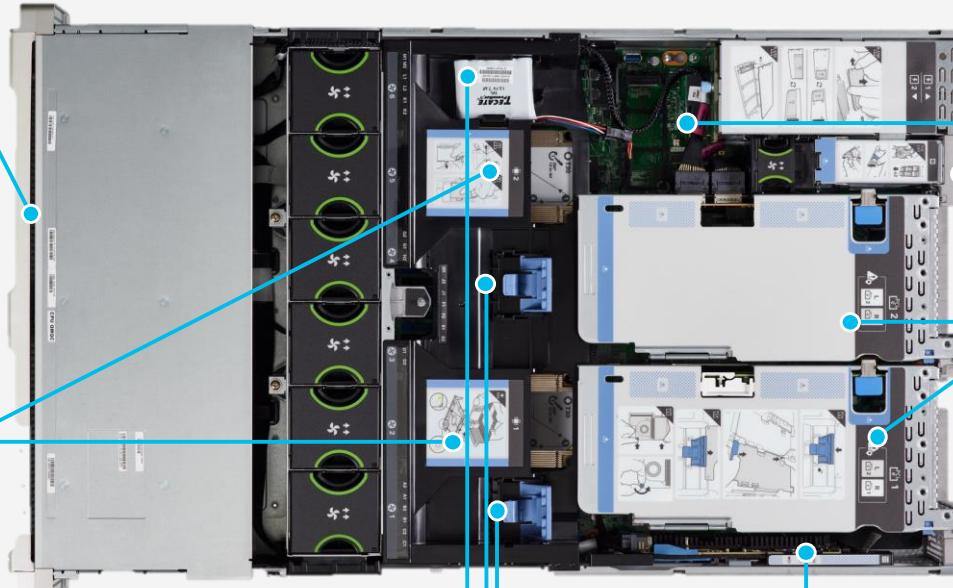

C240 M5

Up to 24 SFF or 12 LFF drives

Support for 4 NVMe PCIe SSDs in mixed configuration, or up to 10 NVMe PCIe SSDs (2 rear) with NVMe-optimized SKU

All SAS and SATA (not NVMe) drives managed by dedicated RAID controller and supported in Cisco UCS® Manager

2 x Intel® Xeon® Scalable processors

24 DIMM sockets
Up to 2666 MHz speeds

Dedicated RAID slot

Modular SD FlexFlash or Modular M.2 (SATA or NVMe)

Up to 2 optional rear hot-swappable 2.5-inch drives
Can be NVMe PCIe SSDs or SAS, SATA, and SSD in standard SKUs

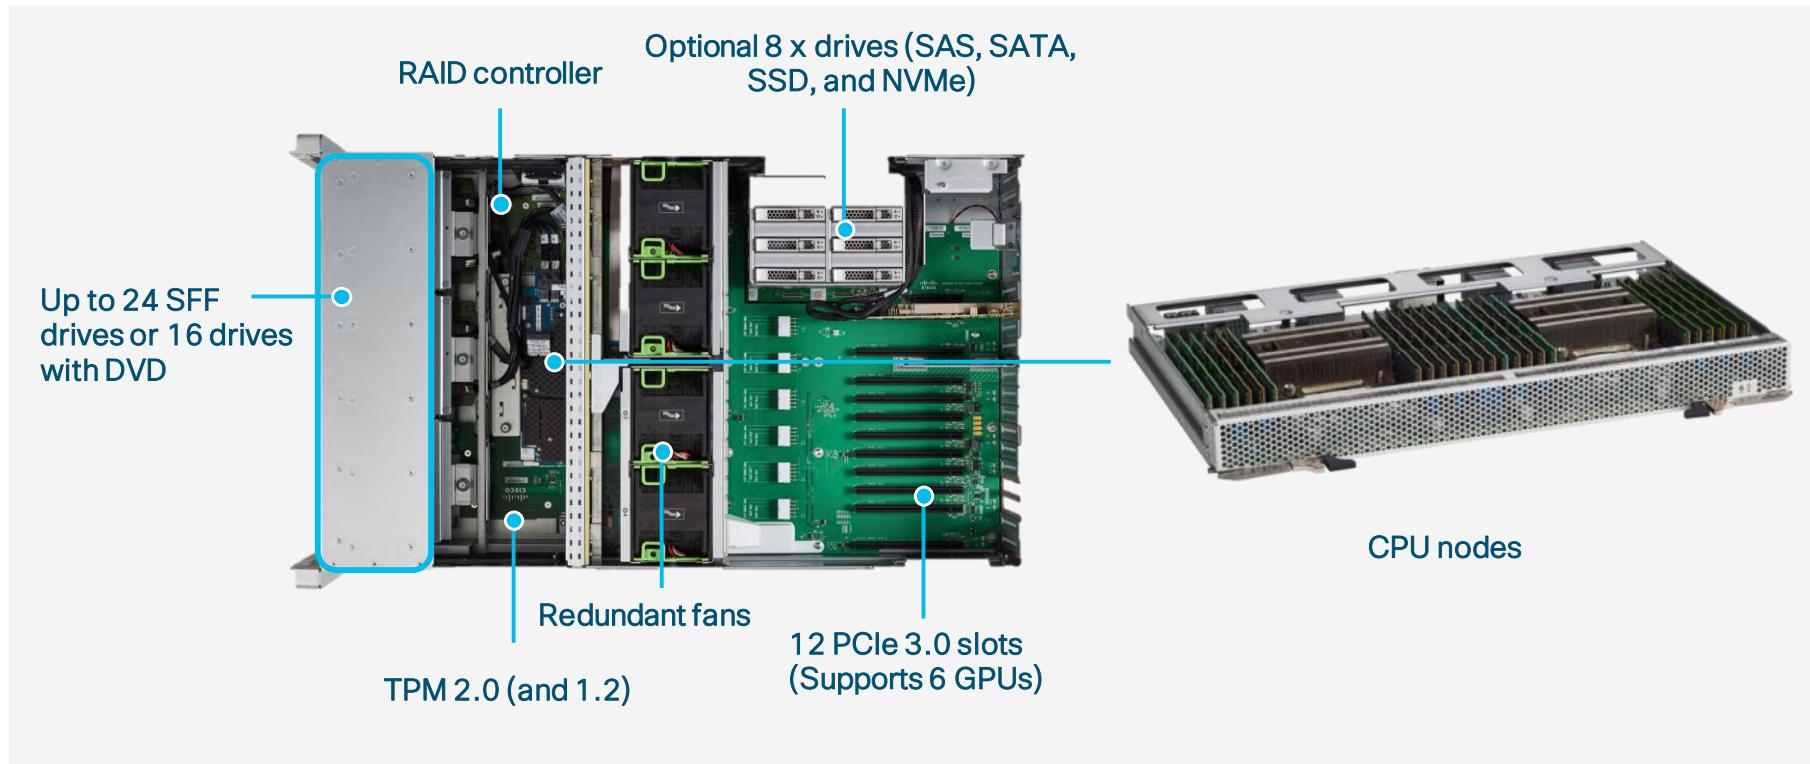

Up to 6 PCIe 3.0 slots
Up to 4 full-height,full-length x16

Support for 2 GPUs

x16 mLOM slot

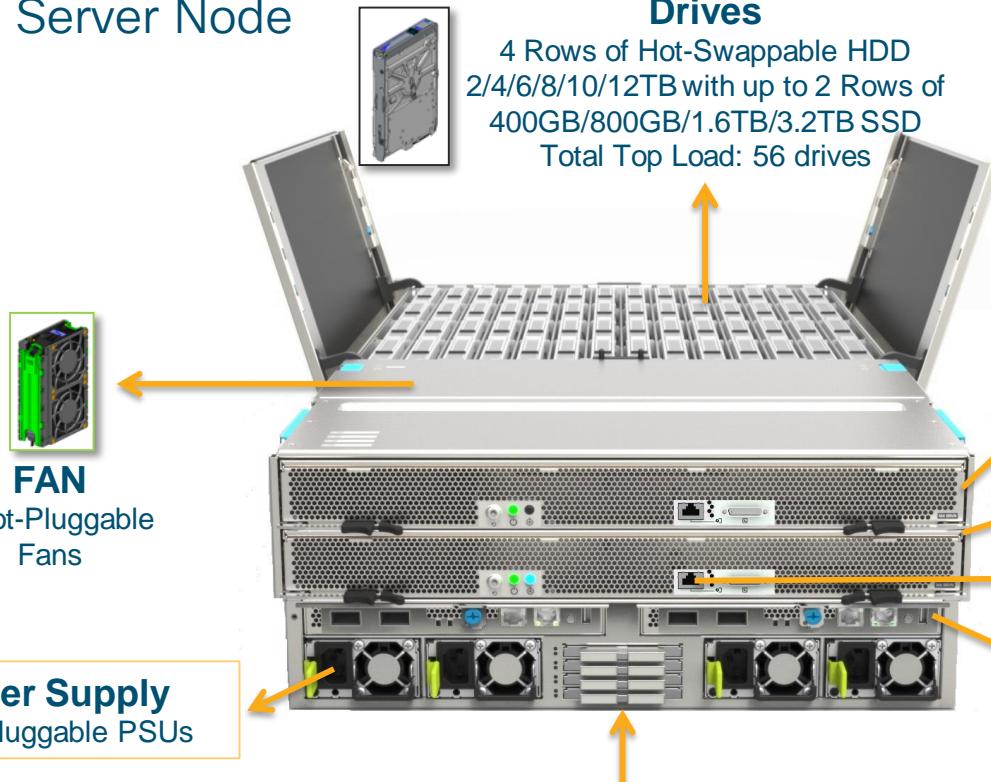

Unified Computing Systems

C480 M5

Cisco UCS S3260 Storage Server

M5 Server Node

Drives

4 Rows of Hot-Swappable HDD
2/4/6/8/10/12TB with up to 2 Rows of
400GB/800GB/1.6TB/3.2TB SSD
Total Top Load: 56 drives

Server Node

Up to (2) Based on 2x Intel Scalable
CPUs, LSI 12G Dual-Chip RAID or Pass-
through HBA, 14x 16/32/64/128GB DDR4
RAM (2 Slots 3D XPoint Ready),
2x 500GB/1TB/2TB NVMe

Optional Second Node

Server Node or Drive Expansion
or PCIe Expansion

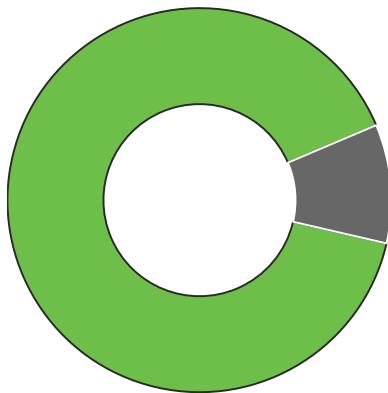

1Gb Host Management Port

System I/O Controller (SIOC)
Up to (2) Cisco VIC 1300(SIOC2)/
1400(SIOC3*) or 3rd Party Adapters*
Up to (2) NVMe per SIOC

UCS GPU Portfolio

UCS Integrated for accelerated VDI, Deep Learning, and HPC Applications

Virtualization

UCS M6 Blade GPU
For M4 blades only

Enterprise Class NVIDIA GPU for
Remote Knowledge Workers,
Task Workers and Designers

UCS P6 Blade GPU
For M5 blades only

Doubles user density for Remote
Knowledge Workers, Task
Workers and Designers

Accelerated Compute

UCS Tesla P100
For M4 and M5
Deep Learning Training and
HPC applications

UCS Tesla V100
**For M5 server only
World's most advanced data
center GPU ever built to
accelerate AI and HPC

UCS NVIDIA M60
For M4 and M5* server
Ultimate choice for Remote
Engineering Workstations
and Application Delivery via
the Cloud

UCS NVIDIA M10
For M4 and M5 servers
Accelerated Remote
Desktop, Maximum User
Density per Server

UCS Tesla P40
For M5 server only
Remote Engineering
Workstations and Fast
Inferencing for Deep
Learning

UCS Tesla P4
For M5 server only
Inferencing Engine for Deep
Learning at the edge.

Blade Optimized GPU

Industry's Only 2-S Blade to offer multiple GPU, densest GPU platform
16 GPU in 6RU Chassis

PID	Description
UCSB-GPU-P6-F	NVIDIA GRID P6 Front Mezzanine

UCS Infrastructure

Unified Computing System Architecture (Blades)

- UCS Manager
Embedded- manages entire system
- UCS 6300 Series Fabric Interconnect
32 x 40GB QSFP+ Port or 24 x 40GB QSFP+ Port & 16 UP Ports
- UCS Fabric Extender – UCS 2x00 Series
Remote line card
- UCS 5100 Series Blade Server Chassis
Flexible bay configurations
- UCS B-Series Blade Server
Industry-standard architecture
- UCS Virtual Adapters
Choice of multiple adapters

Unified Computing Systems

Fabric Interconnects

FI 6332

- 32 x 40GbE QSFP+ ports
- 2.56Tbps switching performance
- 1RU fixed form factor, two power supplies & four fans

FI 6332-16UP

- 24 x 40GbE QSFP+ & 16 x UP ports (1/10GbE or 4/8/16G FC)
- 2.43Tbps switching performance
- 1RU fixed form factor, two power supplies & four fans

Unified Computing Systems

Fabric Extenders

IOM 2304

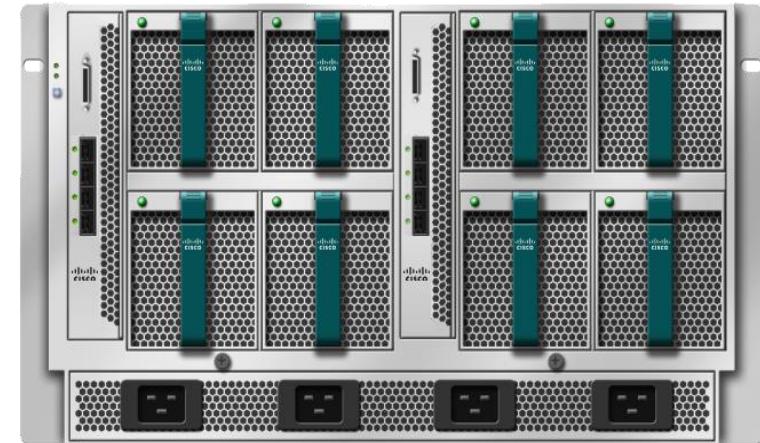

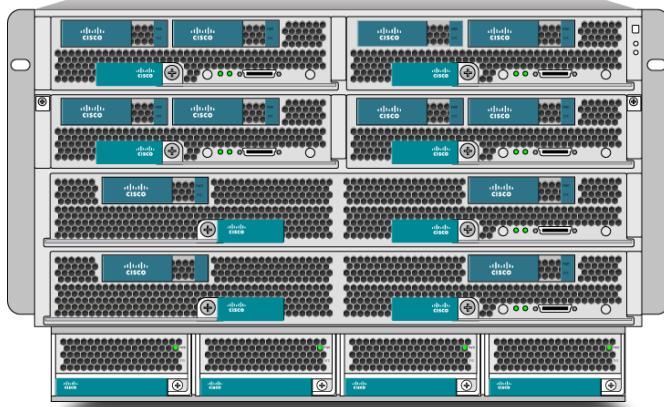

- 8 x 40GbE server links & 4 x 40GbE QSFP+ uplinks
- 960Gbps switching performance
- Modular IOM for UCS 5108

Unified Computing Systems

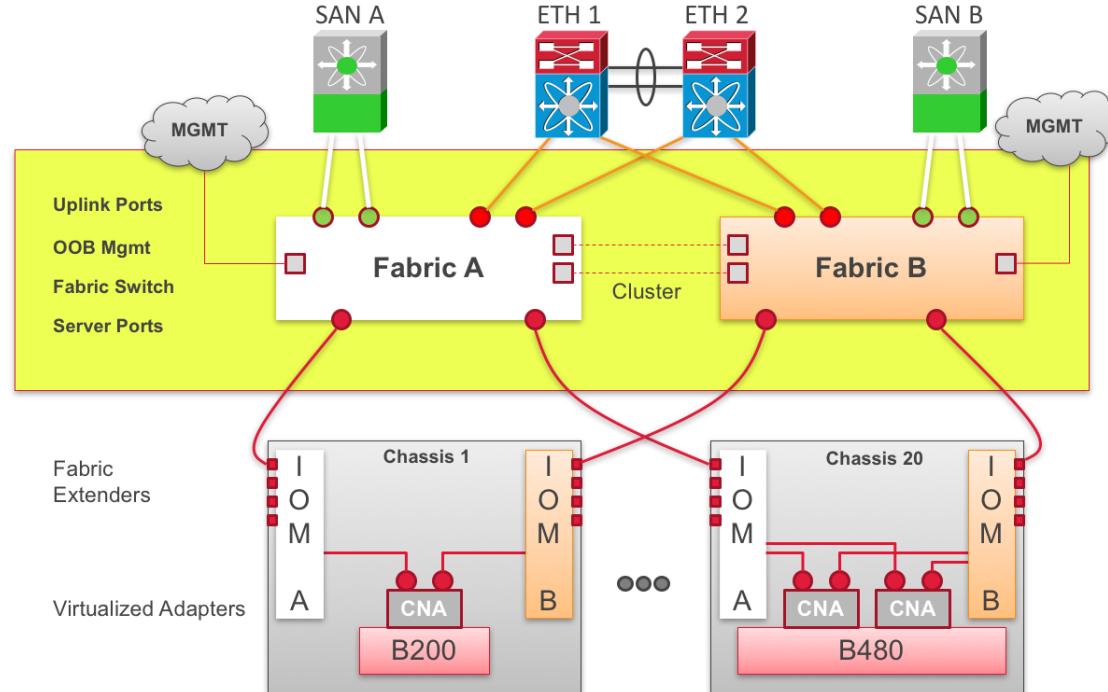

Blades Chassis

- Up to 8 Half width server blades
- Up to 4 Full width server blades
- Redundant Hot Swap Power Supply
- 6RU Enclosure
- 2 Hot Swap FEX
- 8 Hot Swap Fan Module

Unified Computing Systems

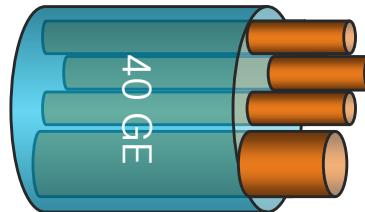

Distributed Architecture, Unified Fabric

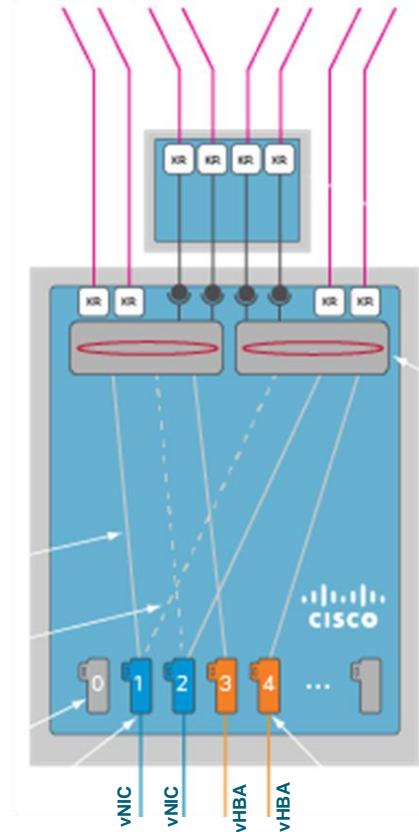

UCS Components

Blade VIC's

- 3rd Generation
 - VIC 1340 mLOM
 - Optional port expander card
 - VIC 1380 Mezz

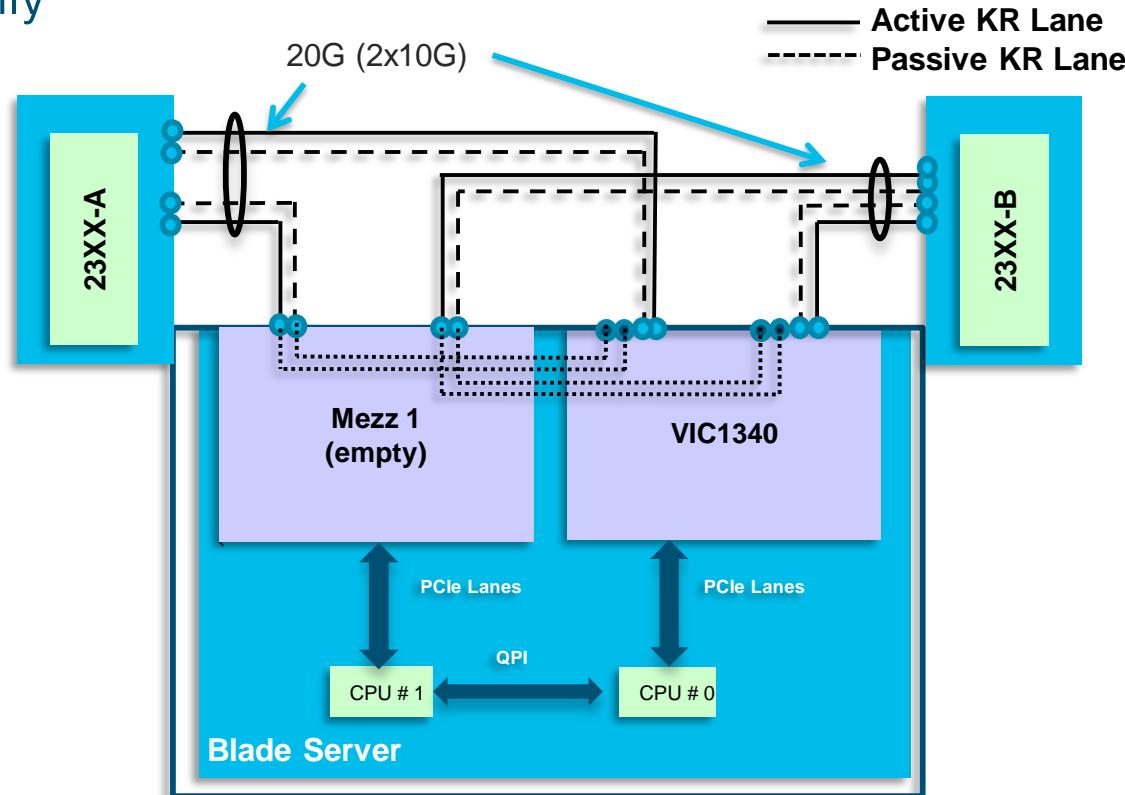

Unified Fabric

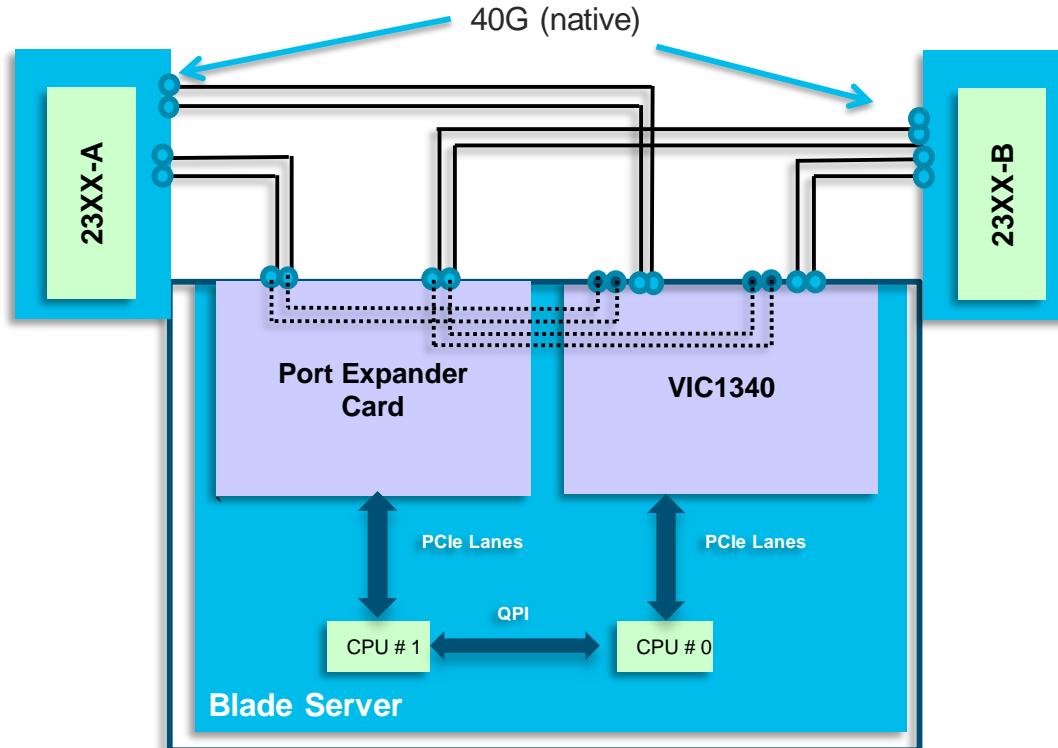

IOM 2304 and Adapter Connection

VIC1340 Only

IOM 2304 and Adapter Connection

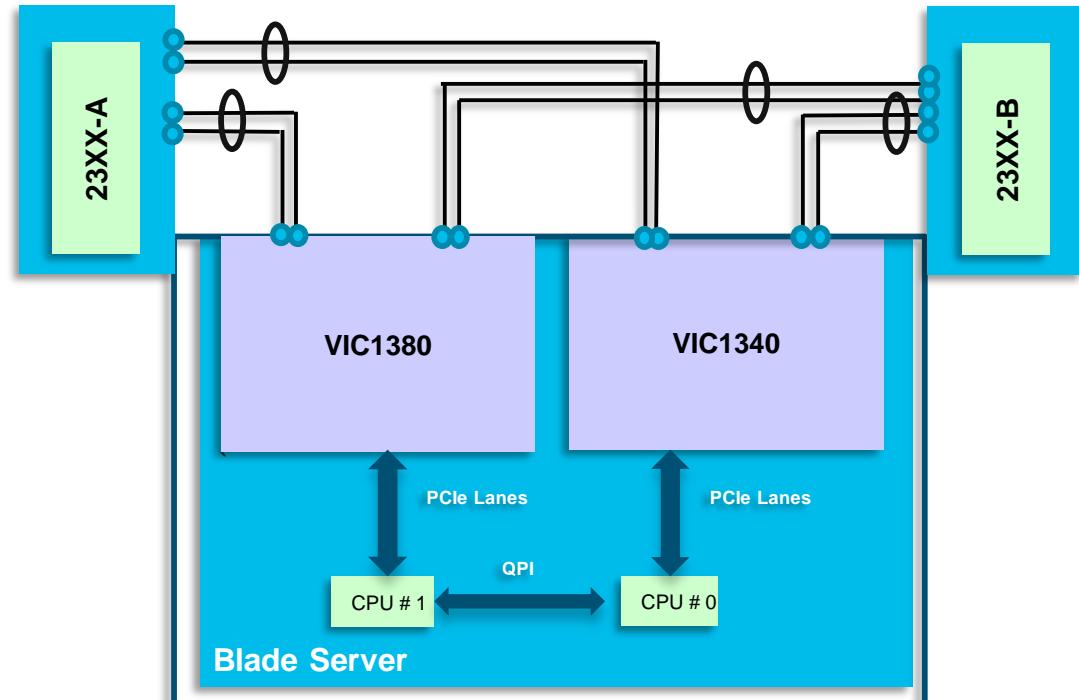

VIC1340 Plus Port Expander

IOM 2304 and Adapter Connection

VIC1340 Plus VIC1380

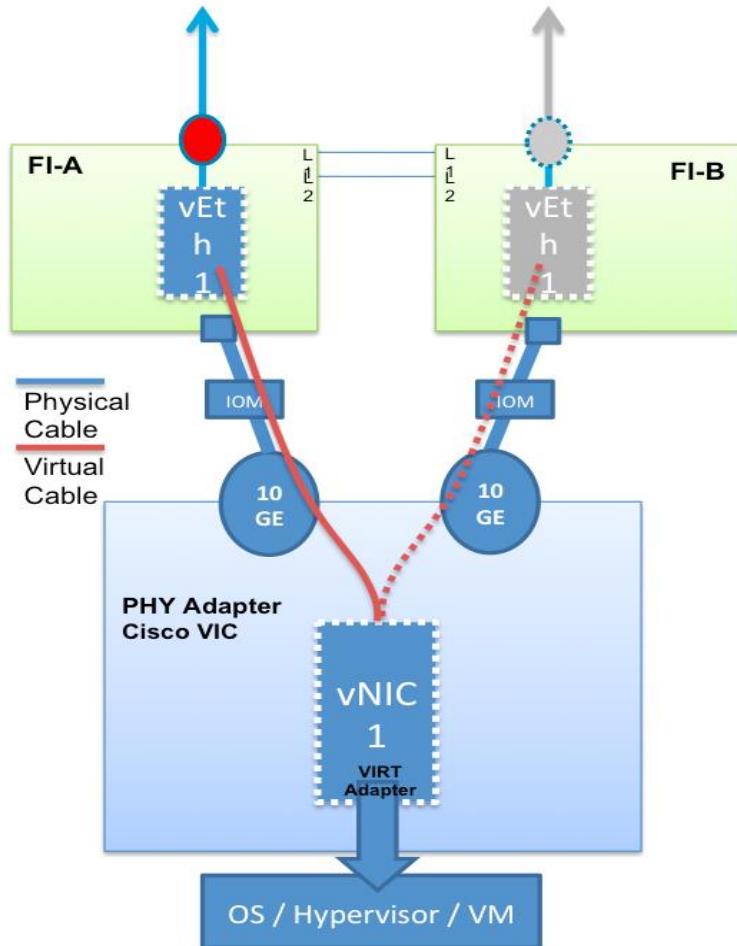

- Adapter Resiliency
 - 2 independent Adapters
 - vCon placement
- 4 20G connections
- 20G are 2x10
- 7 tuple hashing

Unified Computing Systems

UCS Fabric Failover

- Fabric provides NIC failover capabilities chosen when defining a service profile
- Traditionally done using NIC bonding driver in the OS
- Provides failover for both unicast and multicast traffic
- Works for any OS.

Unified Computing System Architecture (Rack)

- UCS Manager

Embedded- manages entire system

- UCS 6300 Series Fabric Interconnect

32 x 40GB QSFP+ Port or 24 x 40GB QSFP+ Port & 16 UP Ports

- UCS C-Series Rack Servers (1U, 2U, 4U)

Industry-standard architecture

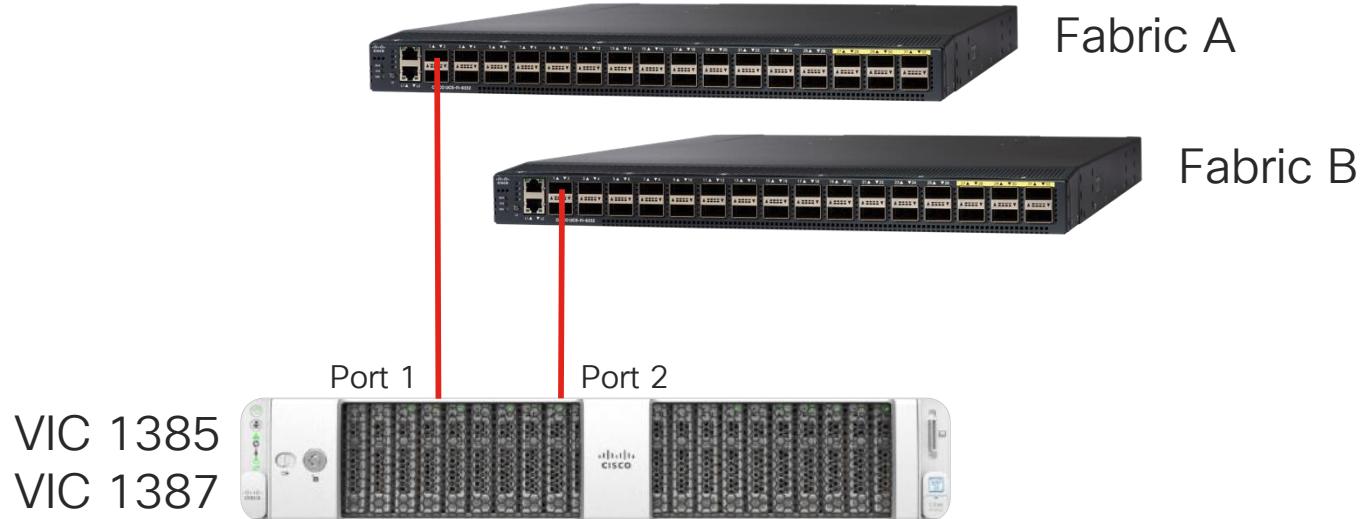

- UCS Virtual Adapters

Choice of multiple adapters

Unified Computing Systems

UCS Managed Rack Server Architecture

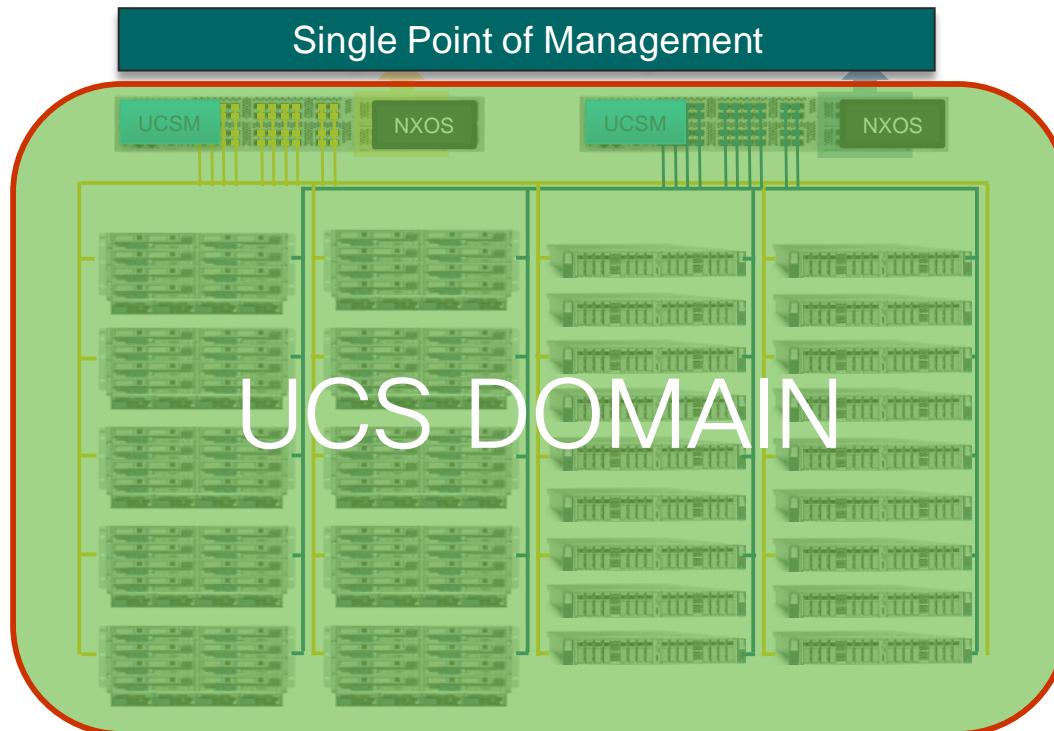

Momentary Lapse for Questions

UCS Advantages

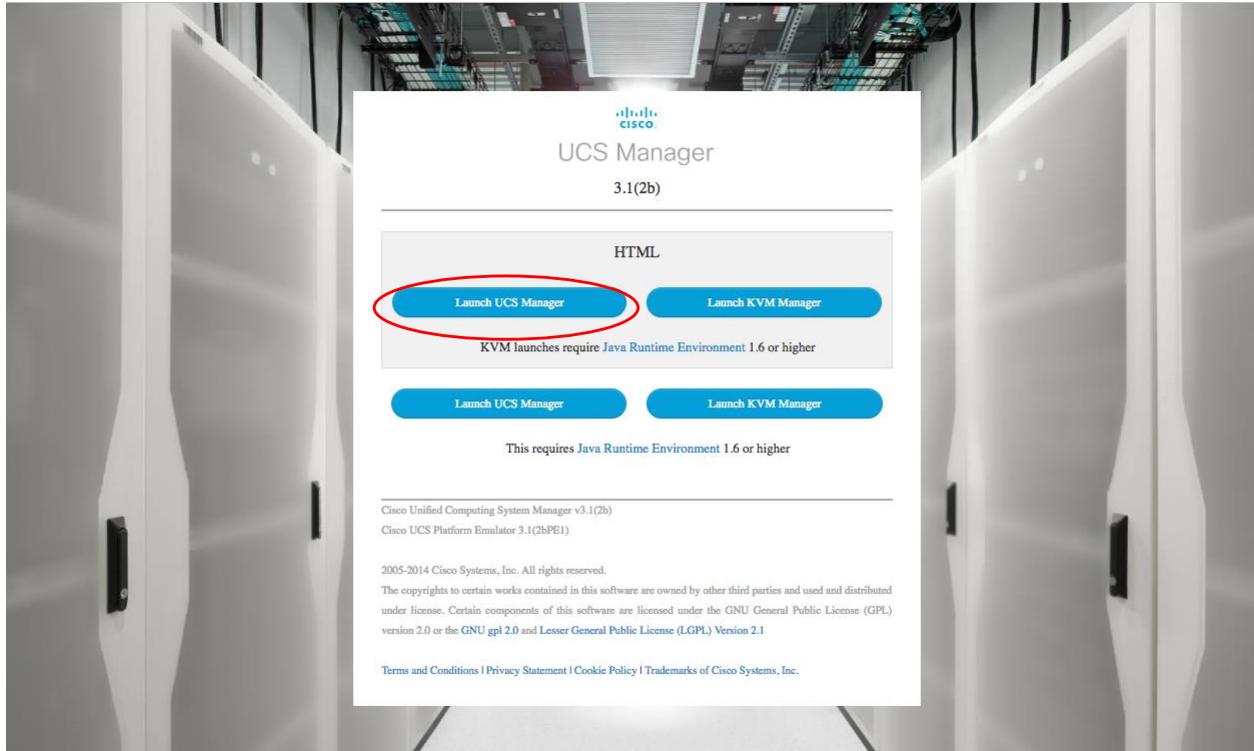

UCS Manager - Advantage #1

Single Point of Management and Scaling – UCS Manager

UCS Manager - Advantage #1

HTML5 Browser Based- Management and KVM

UCS Manager - Advantage #1

Single Point of Management – Equipment

The screenshot displays the UCS Manager web interface, illustrating the 'Single Point of Management – Equipment' advantage. The interface is divided into several sections:

- Header:** Cisco UCS Manager logo, navigation icons (Equipment, Servers, LAN, SAN, VM, Storage, Chassis, Admin), and a search bar.
- Top Bar:** Status indicators (0 crossed-out, 2 yellow, 5 green, 0 blue) and management icons (refresh, search, help).
- Left Sidebar:** A navigation menu with 'Equipment' selected, showing categories like Chassis, Servers, LAN, SAN, VM, Storage, Chassis, and Admin.
- Central View:** The 'Equipment' tab is active, showing a main topology view. It displays two Fabric Interconnects (A and B) connected to a Chassis N. A legend at the bottom indicates link status: black for All Links Up, yellow for Some Links Down, and red for All Links Down.
- Right Sidebar:** A detailed view of the selected 'Equipment' node, listing components such as Chassis, Fabric Interconnect A (primary), and Fabric Interconnect B (subordinate). This sidebar also includes a zoom control (+/-).

UCS Manager - Advantage #1

Single Point of Management – Servers

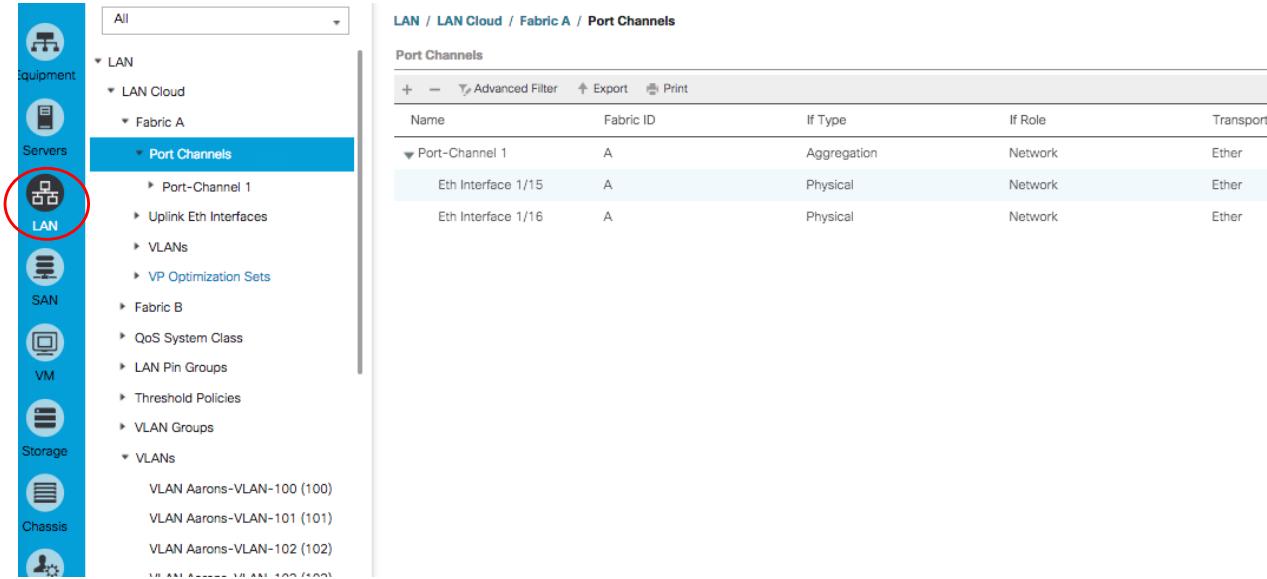

The screenshot shows the UCS Manager web interface. On the left is a navigation sidebar with icons for Equipment, LAN, SAN, VM, Storage, Chassis, and Admin. The 'Servers' icon is circled in red. The main content area shows a breadcrumb path: Servers / Policies / root / BIOS Policies / Aaron-BIOS. Below this are tabs for Main, Advanced, Boot Options, Server Management, and Events. The Advanced tab is selected. Under Processor, various BIOS settings are listed with radio button options for disabled, enabled, or Platform Default. Settings include Turbo Boost, Enhanced Intel Speedstep, Hyper Threading, Core Multi Processing, Execute Disabled Bit, Virtualization Technology (VT), Hardware Pre-fetcher, Adjacent Cache Line Pre-fetcher, DCU Streamer Pre-fetch, DCU IP Pre-fetcher, Direct Cache Access, Processor C State, Processor C1E, Processor C3 Report, Processor C6 Report, Processor C7 Report, Processor CMCI, CPU Performance, Max Variable MTRR Setting, Local X2 APIC, Power Technology, Energy Performance, Frequency Floor Override, and P-STATE Coordination.

Processor Setting	Options
Turbo Boost	<input type="radio"/> disabled <input checked="" type="radio"/> enabled <input type="radio"/> Platform Default

UCS Manager - Advantage #1

Single Point of Management – LAN Connectivity

The screenshot shows the UCS Manager interface for managing LAN connectivity. On the left, a navigation sidebar lists categories like Equipment, Servers, LAN, SAN, VM, Storage, and Chassis. The LAN icon is highlighted with a red circle. The main pane displays the 'Port Channels' section under 'Fabric A'. It includes a table with columns for Name, Fabric ID, If Type, If Role, and Transport. The table shows two entries: 'Port-Channel 1' (Fabric ID A, Aggregation, Network, Ether) and 'Eth Interface 1/15' and 'Eth Interface 1/16' (Fabric ID A, Physical, Network, Ether). Below the table, a list of VLANs is shown: VLAN Aarons-VLAN-100 (100), VLAN Aarons-VLAN-101 (101), and VLAN Aarons-VLAN-102 (102).

Name	Fabric ID	If Type	If Role	Transport
Port-Channel 1	A	Aggregation	Network	Ether
Eth Interface 1/15	A	Physical	Network	Ether
Eth Interface 1/16	A	Physical	Network	Ether

UCS Manager - Advantage #1

Single Point of Management – SAN Connectivity

The screenshot displays the UCS Manager web interface. On the left, a vertical navigation bar lists categories: Equipment, Servers, LAN, SAN (highlighted with a red circle), VM, Storage, Chassis, and Admin. Under the SAN category, the 'VSANs' sub-item is also highlighted with a red circle. The main content area shows a breadcrumb path: SAN / SAN Cloud / VSANs. A table titled 'VSANs' lists configurations for two fabrics: Fabric A and Fabric B. The table columns include Name, ID, Fabric ID, If Type, If Role, Transport, and FCoE. The data is as follows:

Name	ID	Fabric ID	If Type	If Role	Transport	FCoE
Fabric A						
VSANs						
VSAN default (1)	1	Dual	Virtual	Network	Fc	4048
VSAN VSAN-100 (120)	120	Dual	Virtual	Network	Fc	120
VSAN VSAN-121 (121)	121	Dual	Virtual	Network	Fc	121
Fabric B						
VSANs						

UCS Manager - Advantage #1

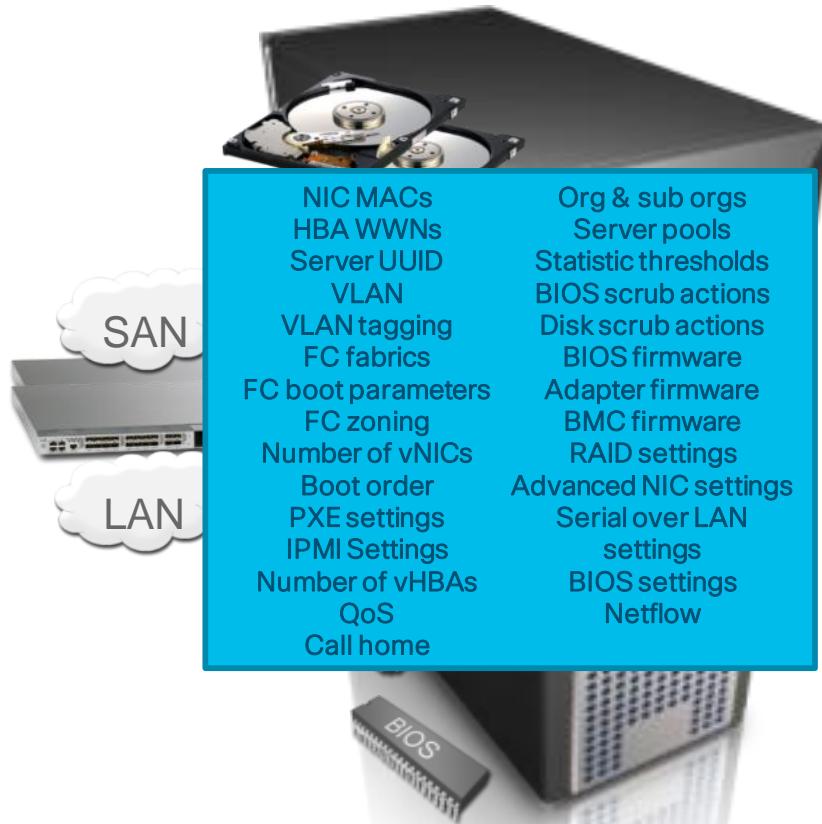

Single Point of Management – Central Administration

The screenshot shows the UCS Manager web interface. On the left, a vertical navigation bar lists various management categories: Equipment, Servers, LAN, SAN, VM, Storage, Chassis, and Admin. The Admin category is circled in red. The main content area is titled "All / Faults, Events and Audit Log". It features a tab navigation bar with "Faults" selected, followed by Events, Audit Logs, Syslog, Core Files, TechSupport Files, and Settings. Below this is a "Filters" section with checkboxes for Severity (Show All, Critical, Major, Minor, Warning, Info, Condition, Cleared, Soaking, Suppressed) and Category (All, Generic, Server, Network, Operations, Sysdebug, FSM, Equipment, Management). The main table displays fault logs with columns: Severity, Code, ID, Affected object, Cause, Last Transition, and Description. A total of 34 faults are listed. At the bottom, there are "Details" sections for the selected fault (Severity: Info, Affected object: sys/chassis-5/slot-2/fabric/port-4, Description: Chassis discovery policy conflict: Link IOM 5/2/4 to peer port B:N/A/1/28 not configured) and "Actions" (ID: 55787, Type: connectivity).

Stateless Computing - Advantage #2

Hardware/Software Abstraction

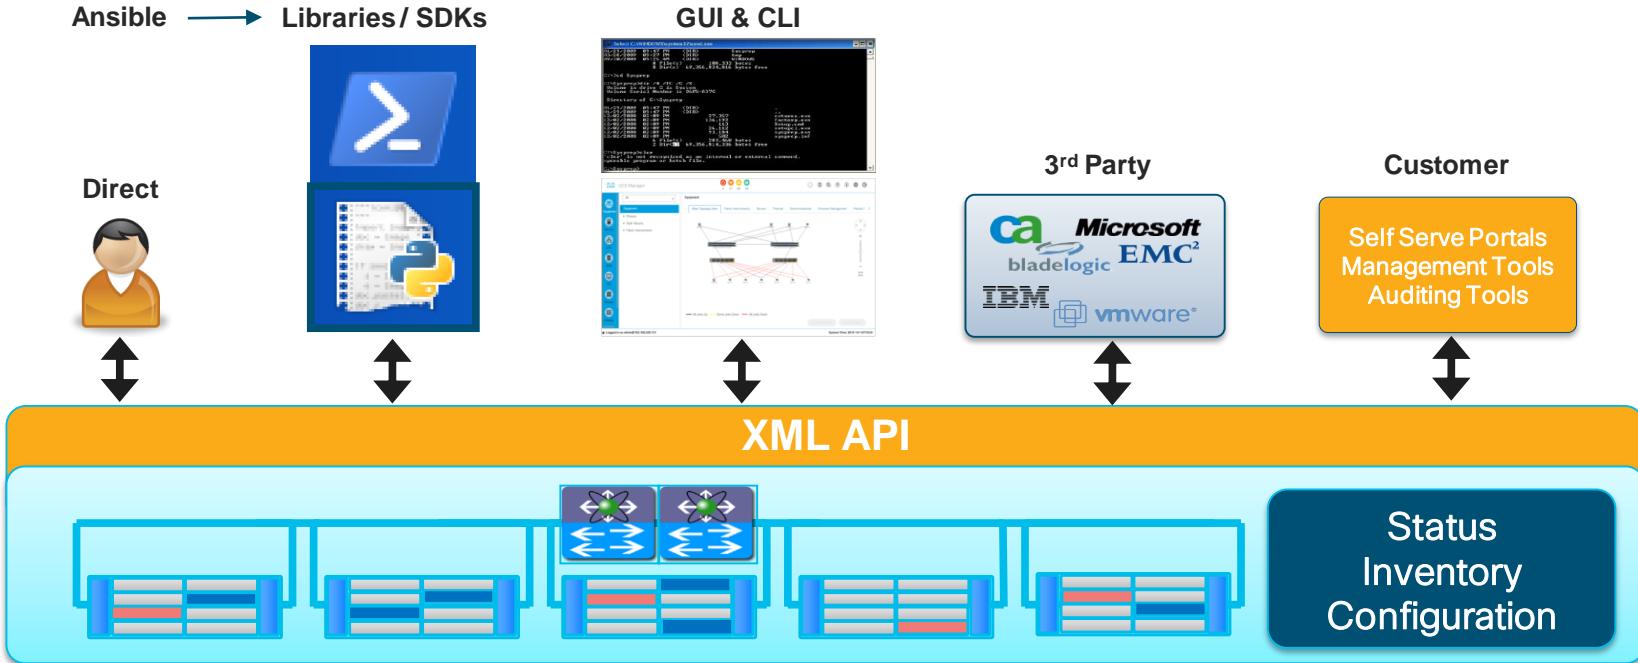

Programmability - Advantage #3

XML API and Other Hidden Gems - Programmatic interface

Programmability - Advantage #3

UCS Management Programmatic Infrastructure

Programmability – Advantage #3

Infrastructure as Code (IaC)

- Specific Configuration Management (CM) tools leverage the XML API, Python SDKs, etc. to support the target device
- You define the intent (end state) in plain text files that CM tools consume
- Intent is version controlled with standard SW dev tools, maybe even tested (e.g. Git, Jenkins)

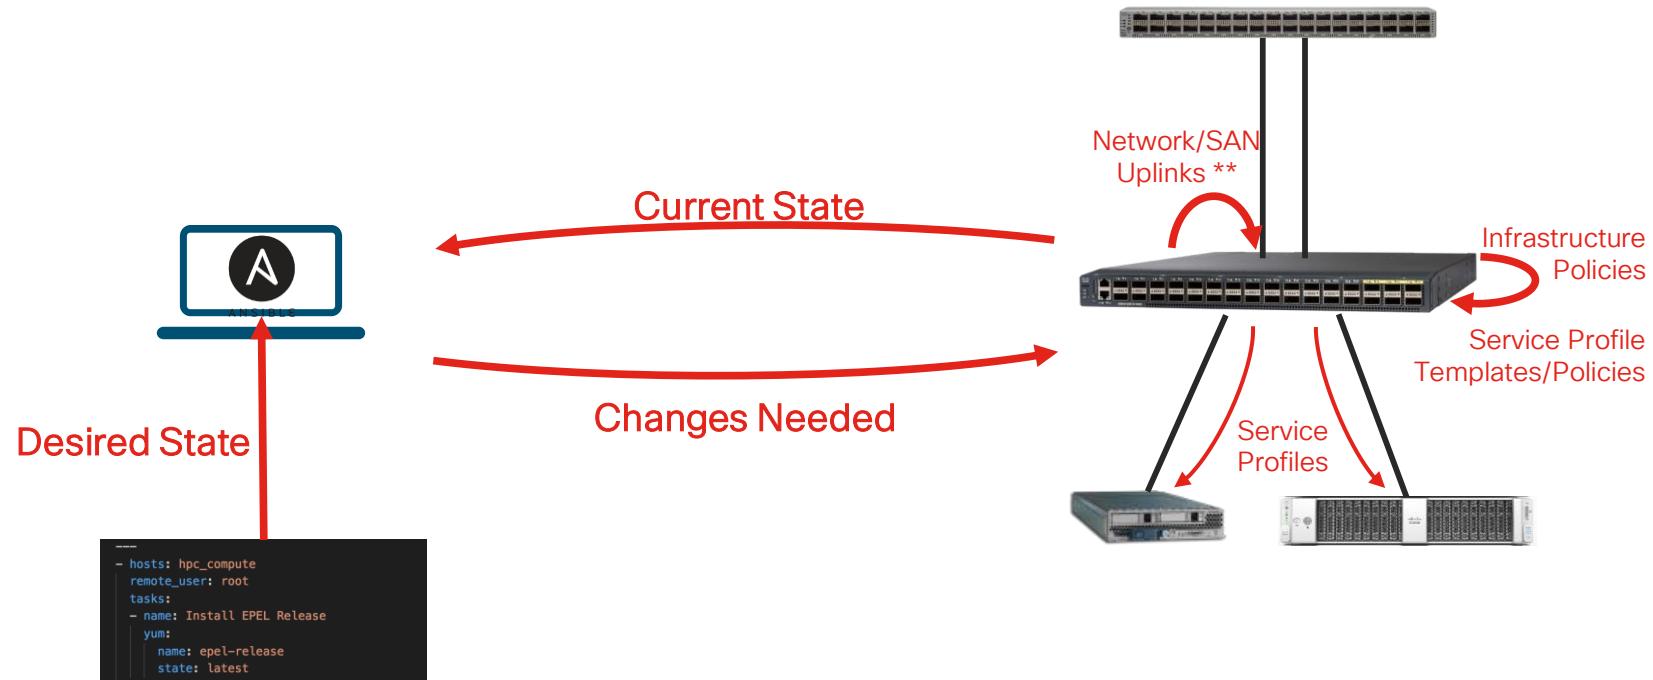

```
Copy | ---  
#!/usr/bin/env python

Questionable pause

UCS Designs

General Architecture Review

“Small” Research Computing Environments

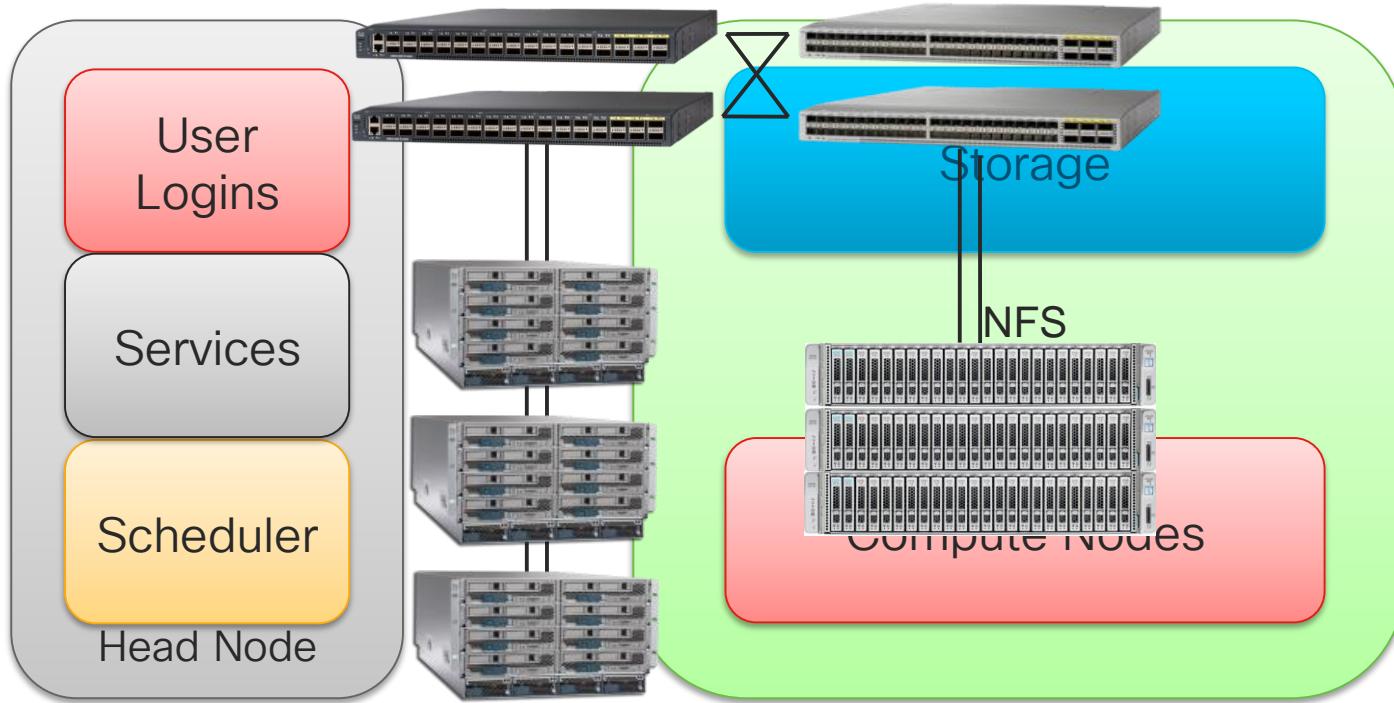

Workload Types

- Compute-bound computations
 - Statistical modeling simulations
 - Small inputs, Large Outputs
- Large scale independent tasks
 - Parameter space search
 - Maybe some multi-core software
- GPU enabled software

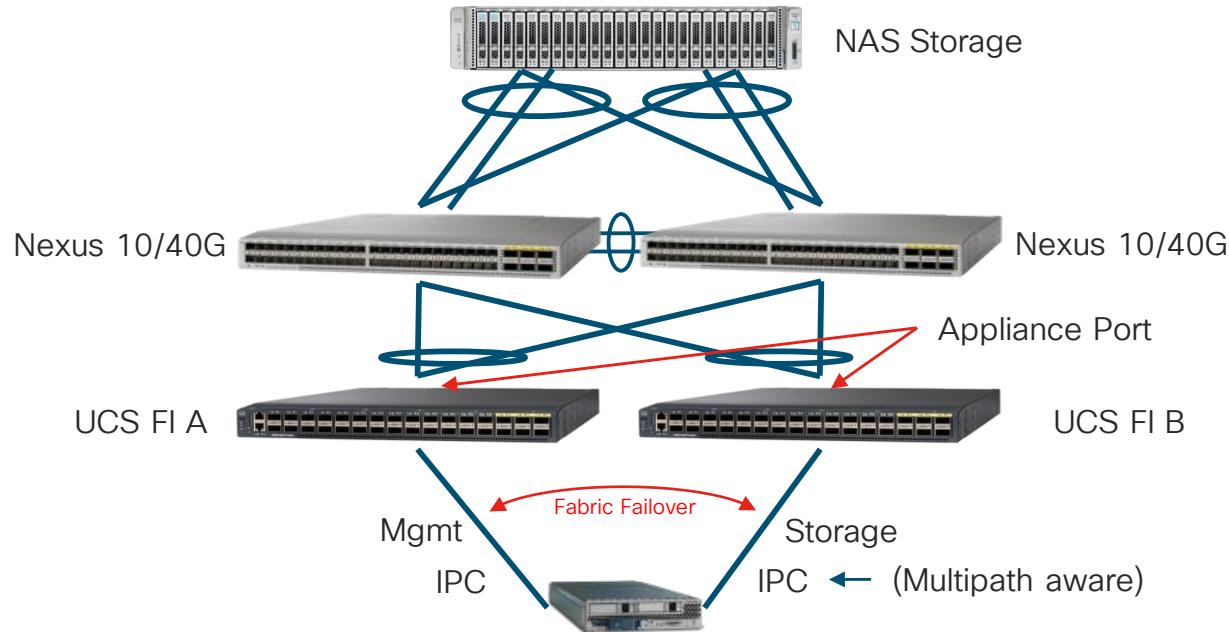

Resource Scale

- Compute
 - 1 UCS domain (<160 nodes)
 - 10GE server
- Networking
 - HPC Local to FI
- Storage
 - Low-modest IOPs
 - GB or smaller streaming r/w

Novel approach to small environments

Implementation Details

“Medium” Research Computing Environments

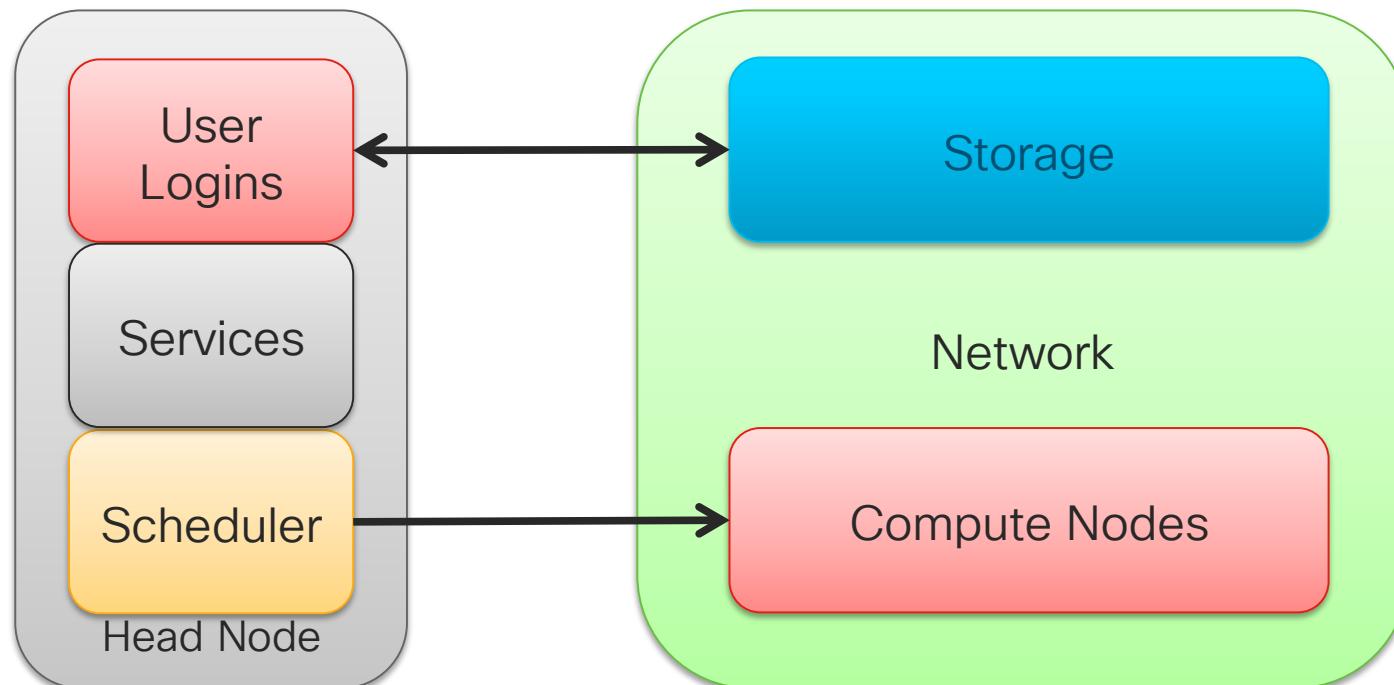

Workload Type

- Multi-node Applications
 - MPI low comm/calc ratio
- TB scale data sets
 - Streaming reads
 - Many nodes, concurrent access
- Balance of I/O and Compute
 - CPU or GPU heavy processing

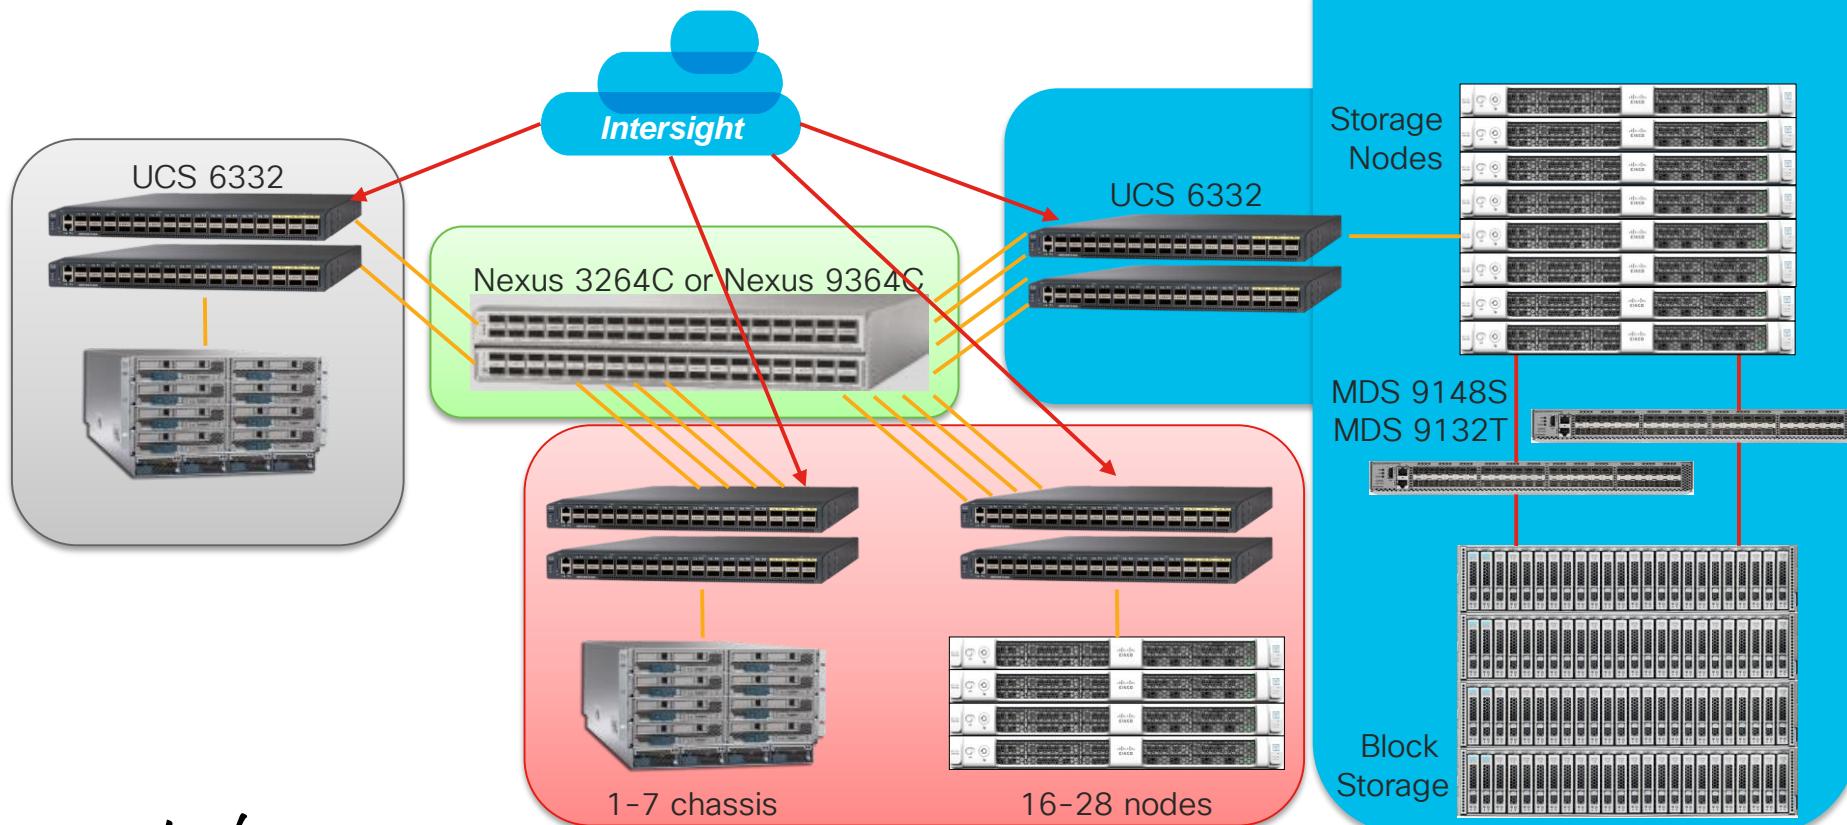

Resource Scale

- Compute
 - Multiple Domains
 - 10GE or 40GE
- Networking
 - Multi-tier UCS/Nexus
- Storage
 - Parallel Filesystems

“Medium” Research Computing Environments

UCS building standard HPC designs

“Large” Research Computing Environments

Workload Types

- Any and all of the above
 - At scales beyond normal DC design
- Tightly coupled analyses
 - Communication heavy
 - Large multi-node applications
 - Messages are small (4-16K)
- Large data sets feeding GPUs
- GPU-to-GPU Direct RDMA Copy

Resource Scale

- Compute
 - 100s to 1000s
- Network
 - Low latency, large bandwidth
 - Separate network infrastructure
- Storage
 - Dedicated parallel FS appliance(s)
 - Multiple clusters of storage servers

HPC on UCS at 100Gbps

It's been a long time
since I asked for
questions

UCS Solution Summary

- UCS has a reliable, low risk portfolio
- UCS offers a proven ease-of-use operational benefits
- UCS enables automation of hardware provisioning that can integrate with established OS configuration management tools
- UCS provides competitive options for small and mid-size research computing environments
- UCS extends competitive computing solutions through support of 3rd party components for advanced communication needs

UCS Sweet Spots

- Better TCO for Enterprises with sustained usage (>30%)
- Leverage HPC environment as part of DR plan
- No dedicated HPC specialists to run infrastructure
- Need platform with automation to integrate into your existing toolsets (Ansible, Puppet, etc)

Agenda

Deep Learning with GPUs

CiscoLive, June, 2018

AGENDA

What is Deep Learning?

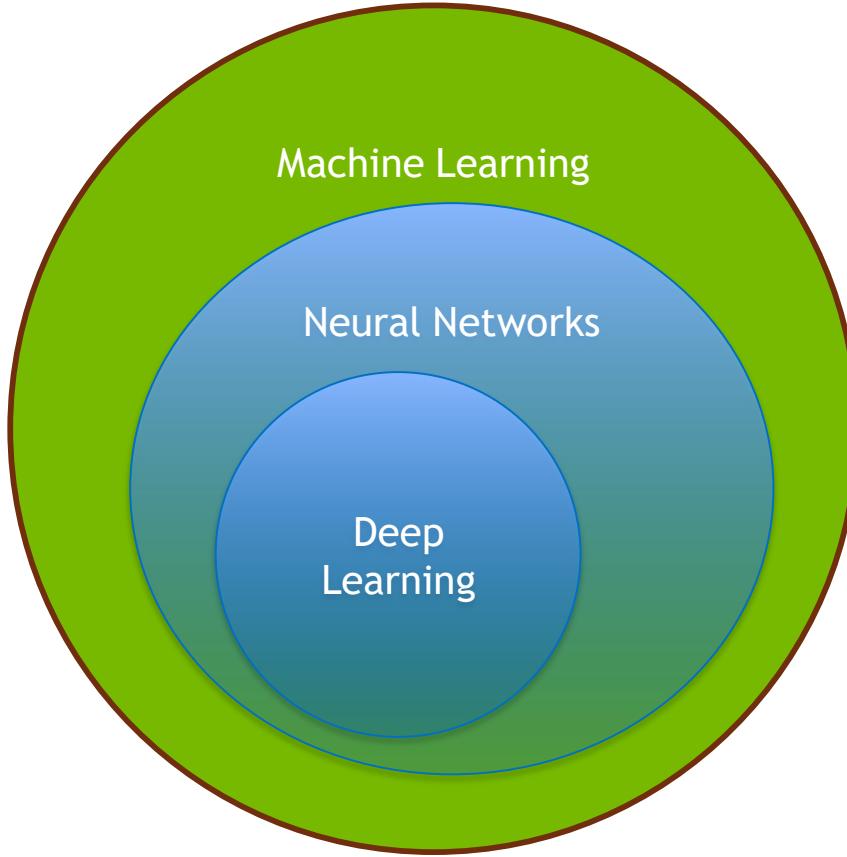

Example Use Cases (Healthcare emphasis)

GPUs and DL

DL in practice

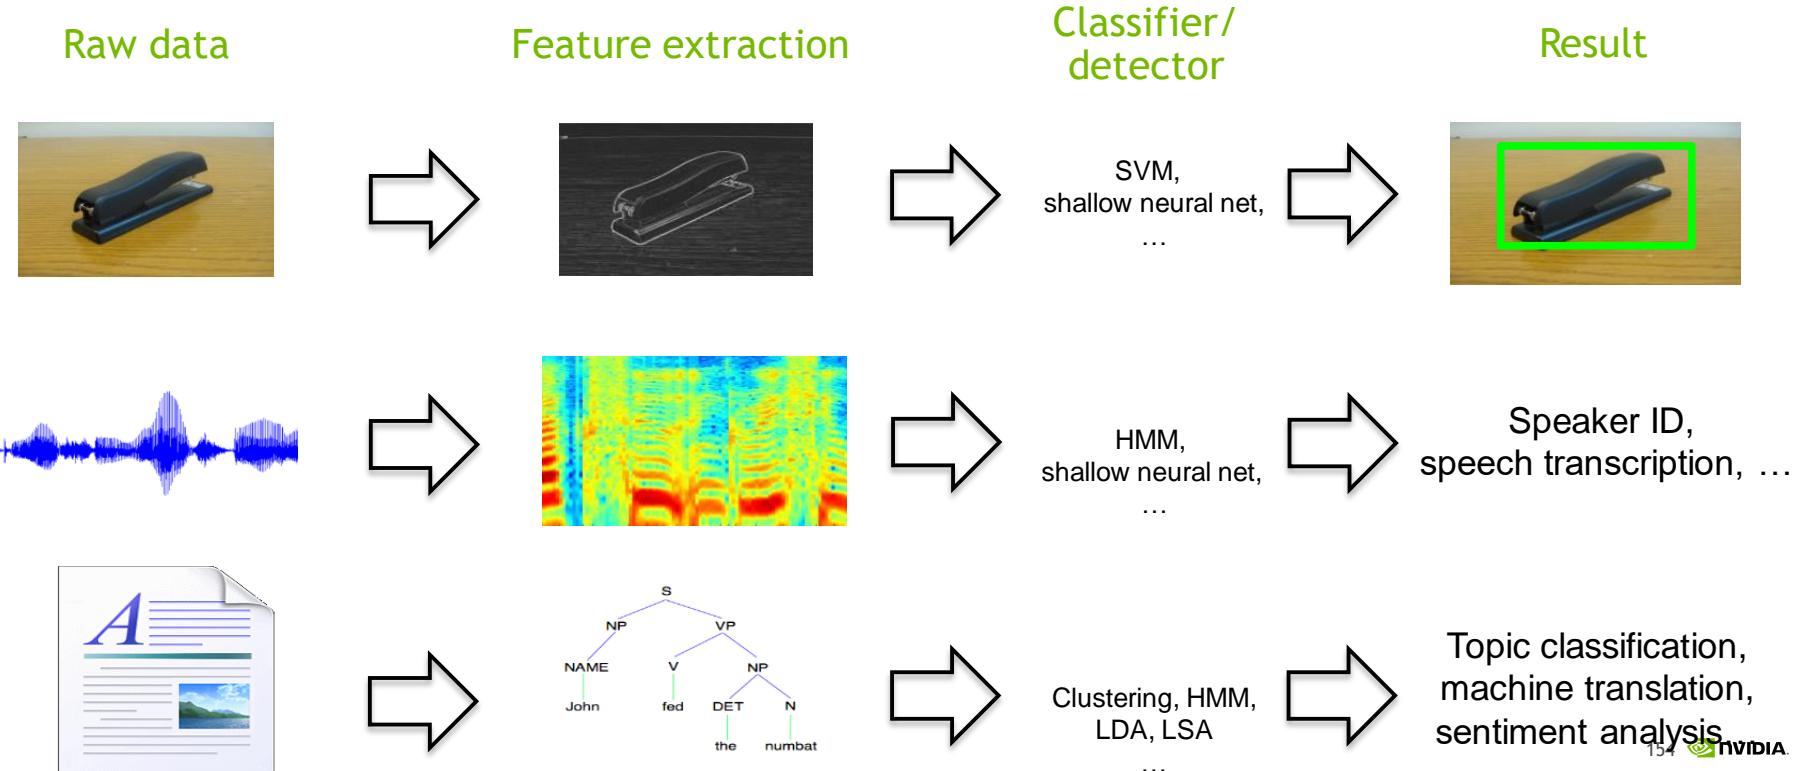

DIGITS Demo (time permitting)

What is Deep Learning?

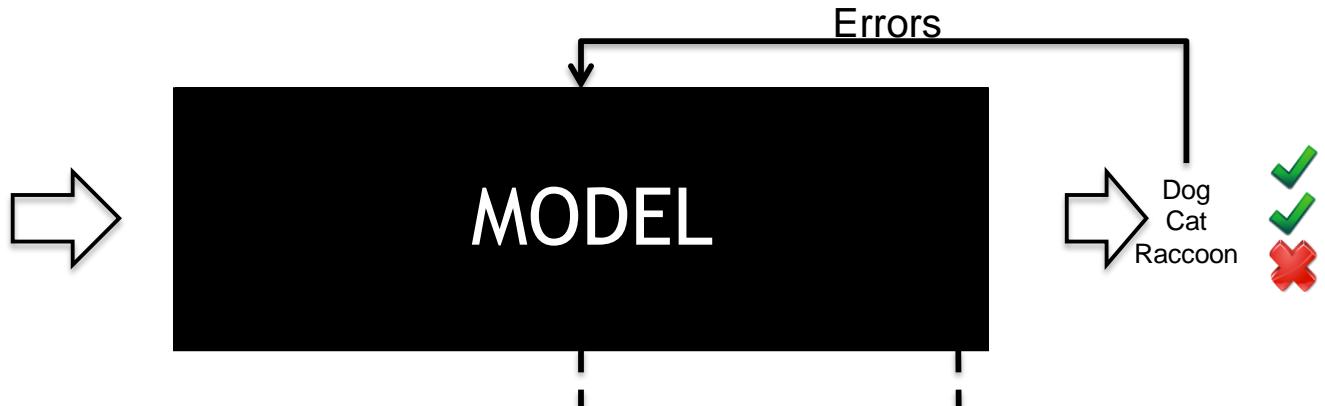

Traditional machine perception

Hand crafted feature extractors

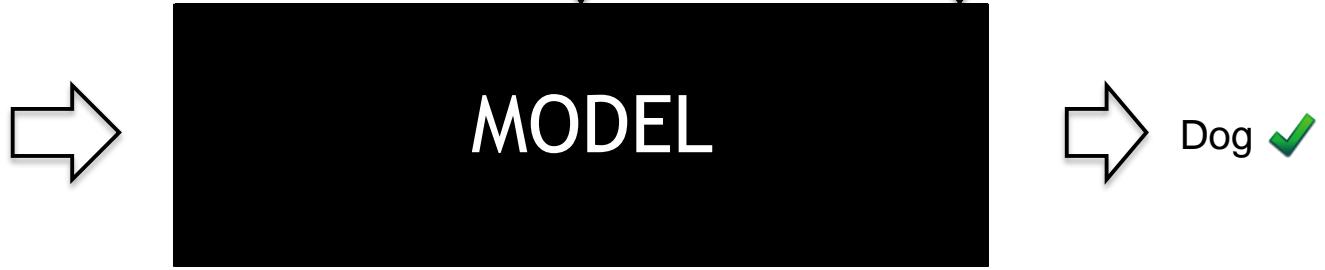

Machine learning approach

Train:

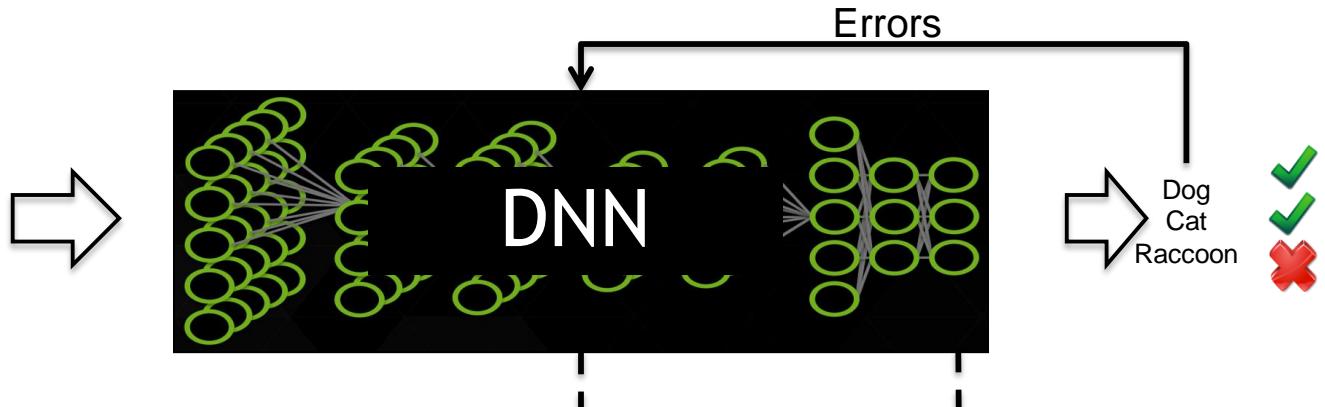

Deploy:

Deep learning approach

Train:

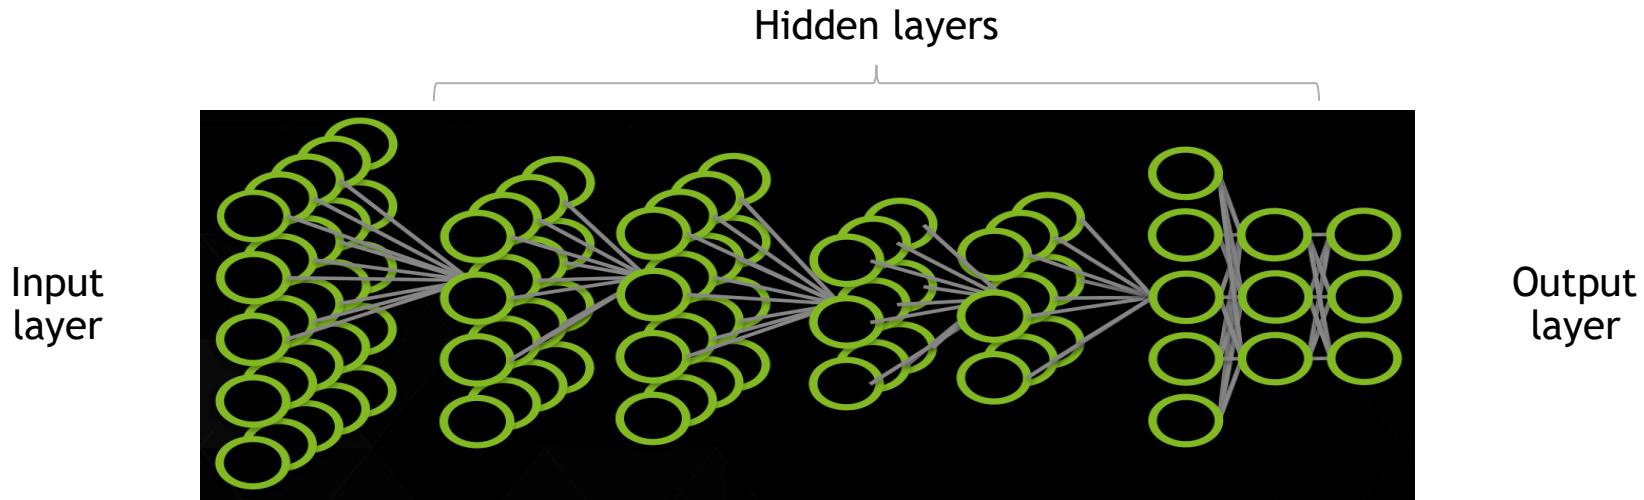

Deploy:

Artificial neural network

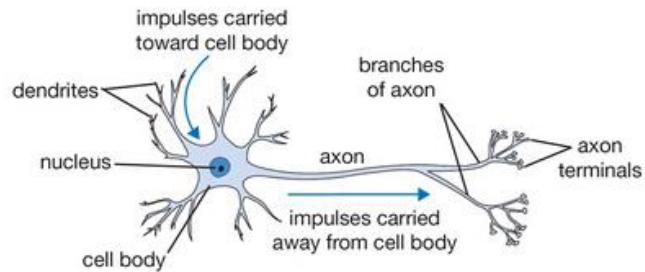

A collection of simple, trainable mathematical units that collectively learn complex functions

Given sufficient training data an artificial neural network can approximate very complex functions mapping raw data to output decisions

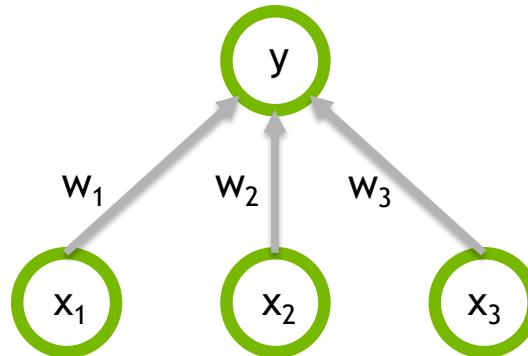

Artificial neurons

Biological neuron

From Stanford cs231n lecture notes

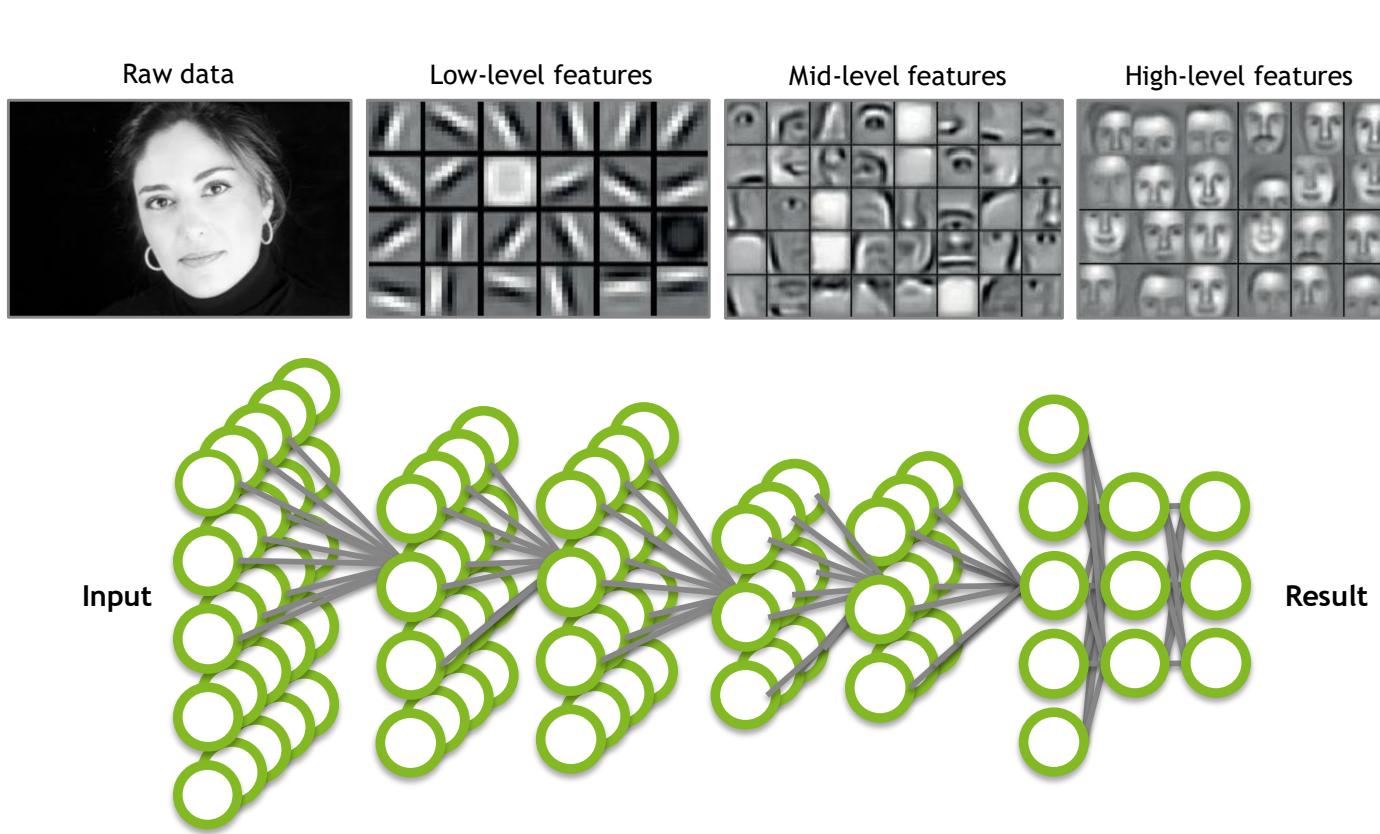

Artificial neuron

$$y = F(w_1x_1 + w_2x_2 + w_3x_3)$$

$$F(x) = \max(0, x)$$

Deep neural network (DNN)

Application components:

Task objective
e.g. Identify face

Training data
10-100M images

Network architecture
~10s-100s of layers

1B parameters

Learning algorithm
~30 Exaflops
1-30 GPU days

Deep learning benefits

- **Robust**

- No need to design the features ahead of time - features are automatically learned to be optimal for the task at hand
- Robustness to natural variations in the data is automatically learned

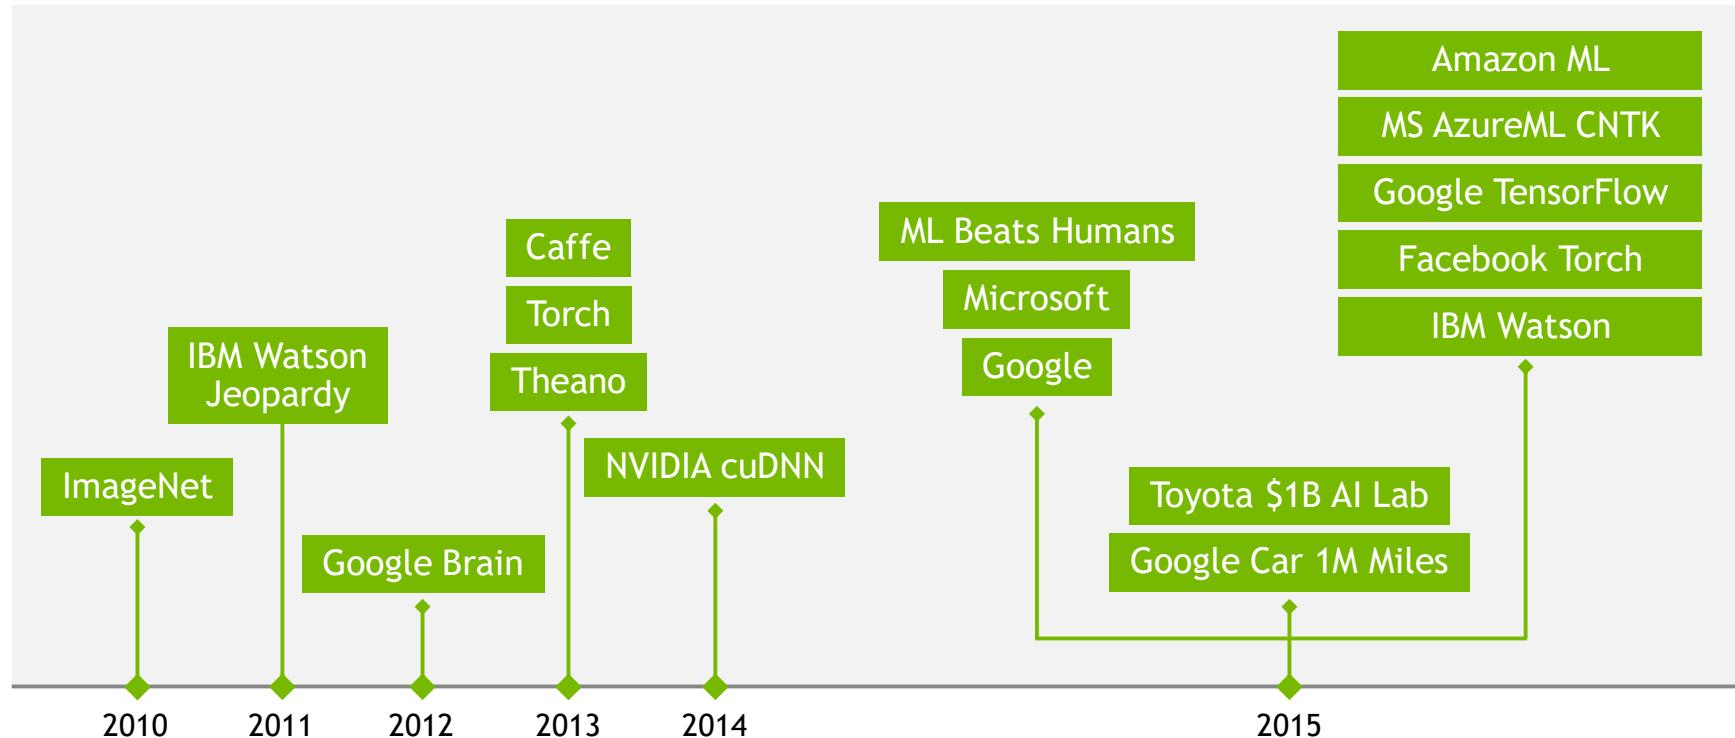

- **Generalizable**

- The same neural net approach can be used for many different applications and data types

- **Scalable**

- Performance improves with more data, method is massively parallelizable

The AI race is on

AlphaGo

First Computer Program to Beat a Human Go Professional

Training DNNs: 3 weeks, 340 million training steps on 50 GPUs

Play: Asynchronous multi-threaded search

Simulations on CPUs, policy and value DNNs in parallel on GPUs

Single machine: 40 search threads, 48 CPUs, and 8 GPUs

Distributed version: 40 search threads, 1202 CPUs and 176 GPUs

Outcome: Beat both European and World Go champions in best of 5 matches

<http://www.nature.com/nature/journal/v529/n7587/full/nature16961.html>

Maximum Efficiency for Scale-out Servers

AlexNet, batch size = 128, CPU: Intel E5-2690v4 using Intel MKL 2017, FPGA is Arria10-115
P4 board power: 64W, V100 board power: 218W, CPU power: 196W includes CPU and RAM power, FPGA performance/watt taken from Intel whitepaper titled "An OpenCL™ Deep Learning Accelerator on Arria 10"

8x Efficient vs CPU, 5x Efficient vs FPGA

P4	
# of CUDA Cores	2560
Peak Single Precision	5.5 Teraflops
Peak INT8	22 TOPS
Low Precision	4x 8-bit vector dot product with 32-bit accumulate
Video Engines	1x decode engine, 2x encode engine
GDDR5 Memory	8 GB @ 192 GB/s
Power	50W & 75 W

NCCL

NVIDIA DEEP LEARNING SOFTWARE PLATFORM

NVIDIA DEEP LEARNING SDK

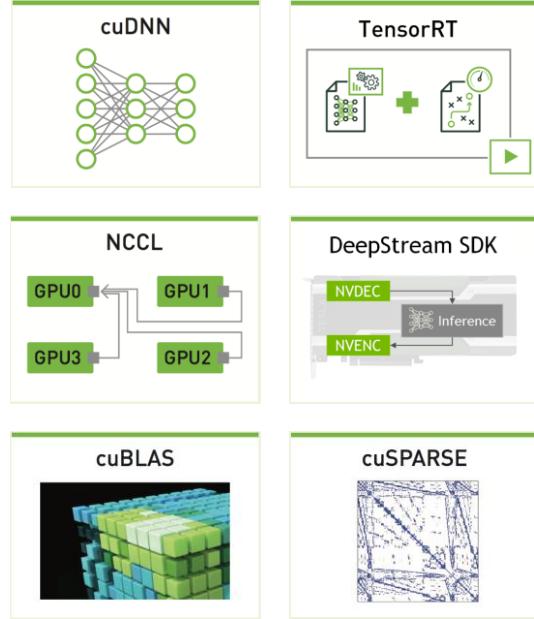

High performance GPU-acceleration for deep learning

Powerful tools and libraries for designing and deploying GPU-accelerated deep learning applications

High performance building blocks for training and deploying deep neural networks on NVIDIA GPUs

Industry vetted deep learning algorithms and linear algebra subroutines for developing novel deep neural networks

Multi-GPU and multi-node scaling that accelerates training on up to eight GPU

“ We are amazed by the steady stream of improvements made to the NVIDIA Deep Learning SDK and the speedups that they deliver. ”

— Frédéric Bastien, Team Lead (Theano) MILA

NVIDIA cuDNN

Deep Learning Primitives

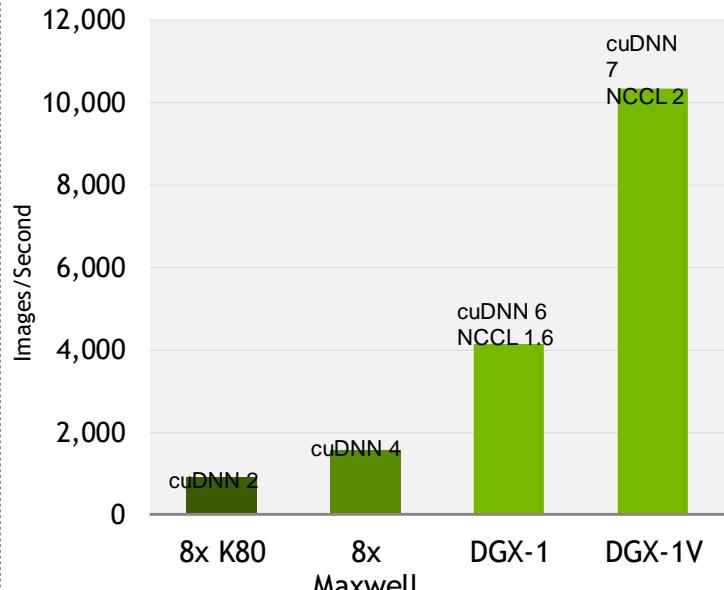

High performance building blocks for deep learning frameworks

Drop-in acceleration for widely used deep learning frameworks such as Caffe2, Microsoft Cognitive Toolkit, PyTorch, Tensorflow, Theano and others

Accelerates industry vetted deep learning algorithms, such as convolutions, LSTM RNNs, fully connected, and pooling layers

Fast deep learning training performance tuned for NVIDIA GPUs

Deep Learning Training Performance

“NVIDIA has improved the speed of cuDNN with each release while extending the interface to more operations and devices at the same time.”

— Evan Shelhamer, Lead Caffe Developer, UC Berkeley

NVIDIA TensorRT 3

Programmable Inference Accelerator

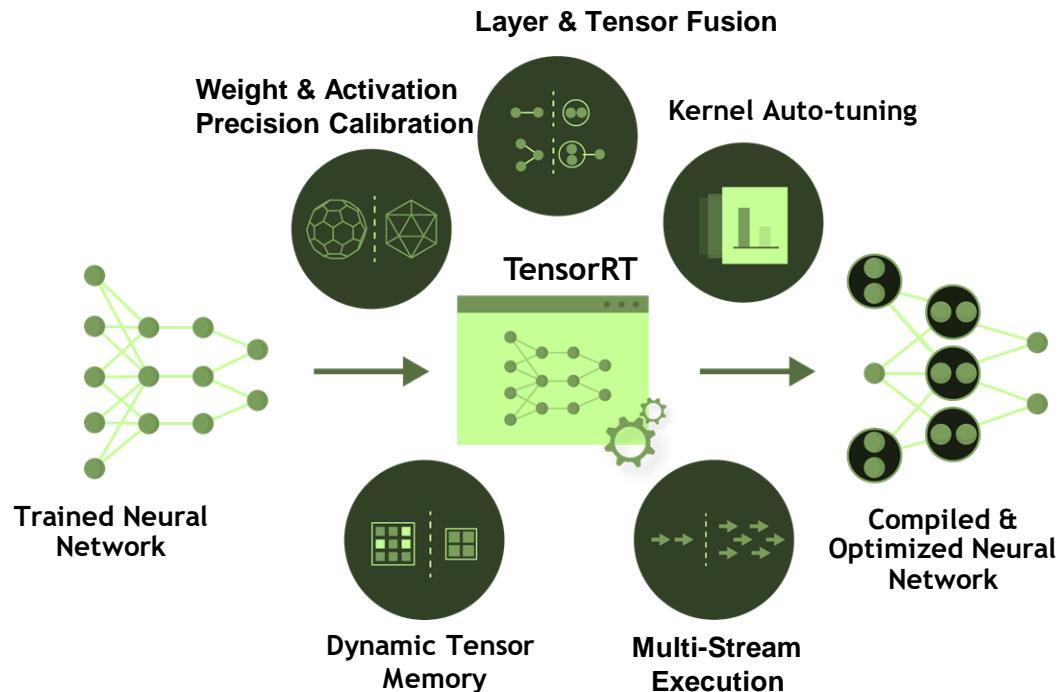

Compiler for Optimized Neural Networks

Weight & Activation Precision Calibration

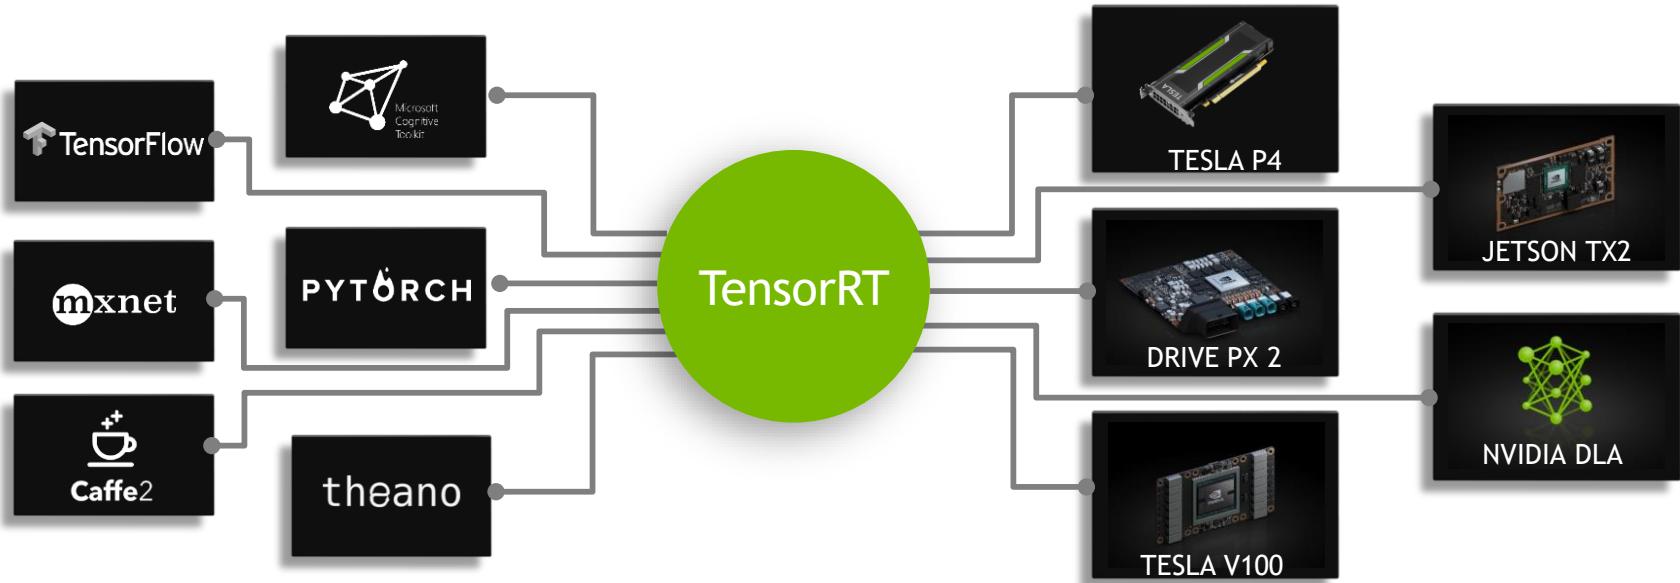

Layer & Tensor Fusion

Kernel Auto-Tuning

Multi-Stream Execution

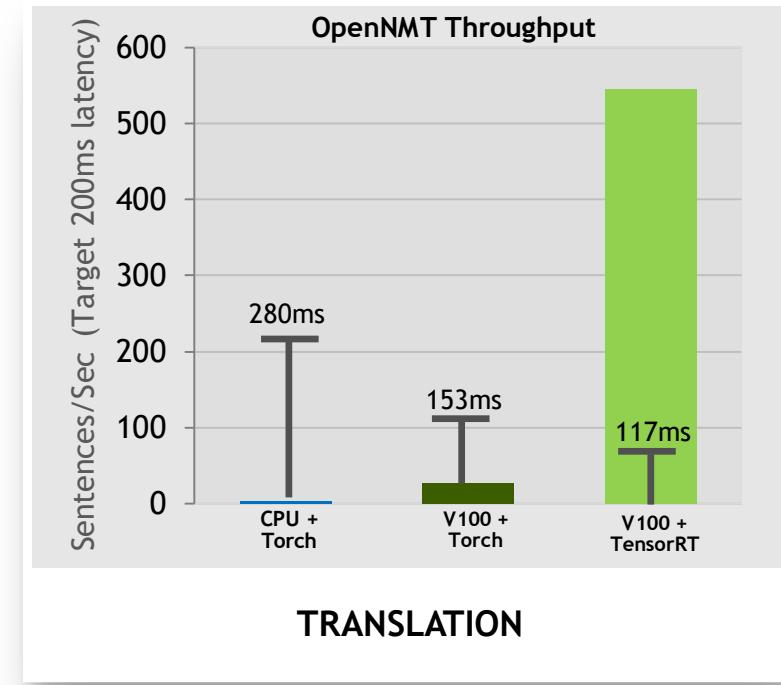

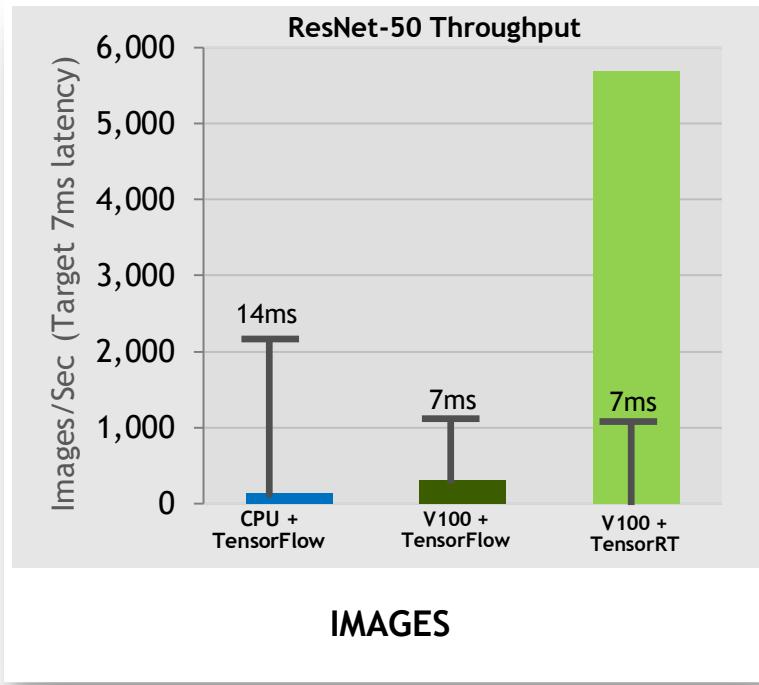

NVIDIA TENSORRT PROGRAMMABLE INFERENCE ACCELERATOR

NVIDIA TENSORRT 3

World's Fastest Inference Platform

NVIDIA Collective Communications Library (NCCL)

Multi-GPU and multi-node collective communication primitives

High-performance multi-GPU and multi-node collective communication primitives optimized for NVIDIA GPUs

Fast routines for multi-GPU multi-node acceleration that maximizes inter-GPU bandwidth utilization

Easy to integrate and MPI compatible. Uses automatic topology detection to scale HPC and deep learning applications over PCIe and NVLink

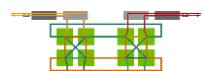

Accelerates leading deep learning frameworks such as Caffe2, Microsoft Cognitive Toolkit, MXNet, PyTorch and more

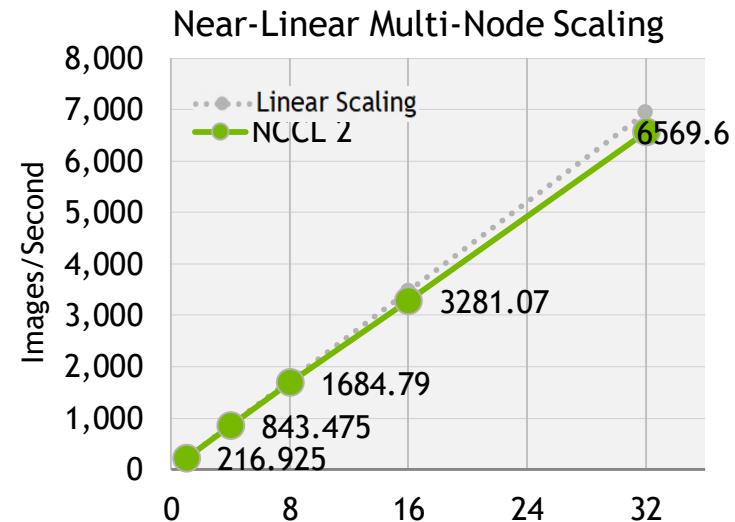

Multi-GPU:
NVLink, PCIe

Multi-Node:
InfiniBand

Detection

Microsoft Cognitive Toolkit multi-node scaling performance (images/sec), NVIDIA DGX-1 + cuDNN 6 (FP32), ResNet50, Batch size: 64

NVIDIA DIGITS

Interactive Deep Learning GPU Training System

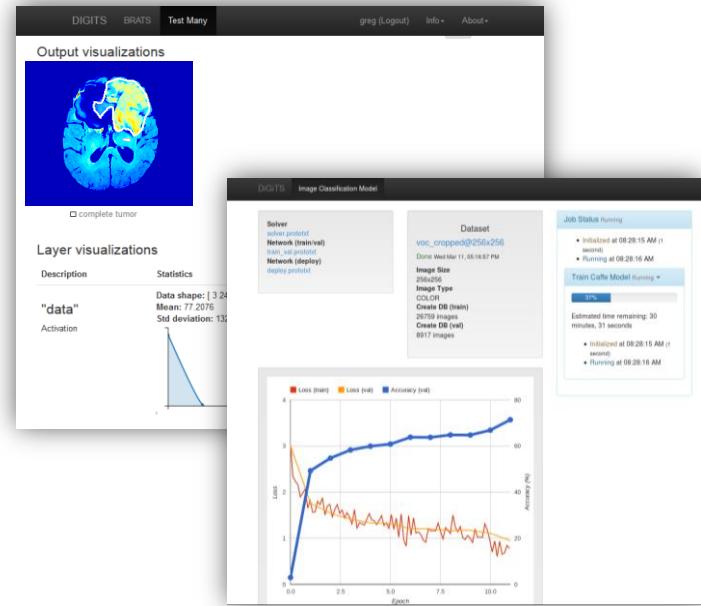

Interactive deep learning training application for engineers and data scientists

Simplify deep neural network training with an interactive interface to train and validate, and visualize results

Built-in workflows for image classification, object detection and image segmentation

Improve model accuracy with pre-trained models from the DIGITS Model Store

Faster time to solution with multi-GPU acceleration

DIGITS Demo

Takeaways

TAKEAWAYS

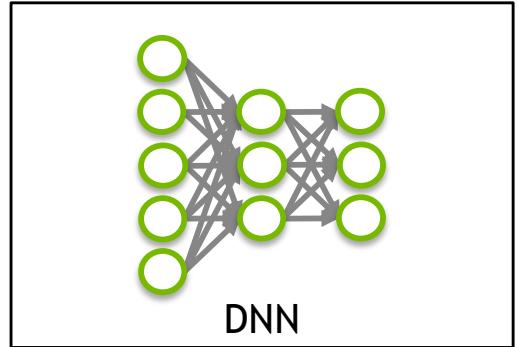

DL, GPUs and Big Data are combining to create the “Big Bang” in Artificial Intelligence

Deep Learning is solving problems that ML can't

NVIDIA provides both HW and SW building blocks to accelerate DL workflows: “**You choose the DL framework, we'll make it run fast**”

Tesla V100 for most HPC and AI/DL workflows

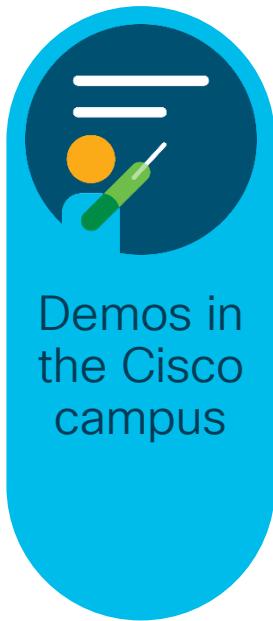

Tesla P4 for datacenter inferencing

Agenda

- Introduction
- Anatomy of Research Computing
- Demo and Hands-on Cluster Operations
- UCS as a Platform for Research Computing
- Hands-on Bonus: UCS Configuration with Ansible
- NVIDIA Deep Learning with GPUs
- Conclusion

Complete your online session evaluation

Give us your feedback to be entered into a Daily Survey Drawing.

Complete your session surveys through the Cisco Live mobile app or on www.CiscoLive.com/us.

Don't forget: Cisco Live sessions will be available for viewing on demand after the event at www.CiscoLive.com/Online.

Cisco Webex Teams

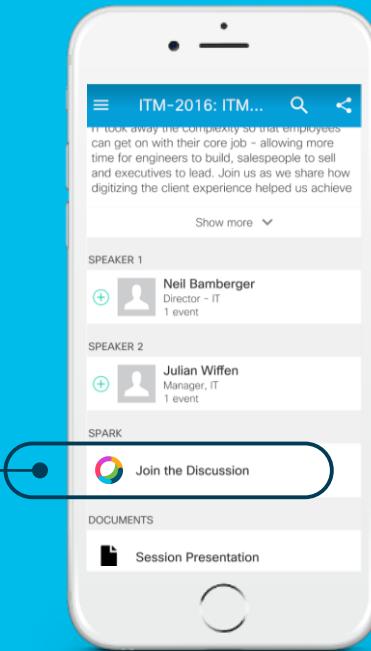

Questions?

Use Cisco Webex Teams (formerly Cisco Spark)
to chat with the speaker after the session

How

- 1 Find this session in the Cisco Live Mobile App
- 2 Click “Join the Discussion”
- 3 Install Webex Teams or go directly to the team space
- 4 Enter messages/questions in the team space

Webex Teams will be moderated
by the speaker until June 18, 2018.
